HISTORY

Revision	Date	Note
Rev 0.1	02/24/2012	<p>Initial Release</p> <ol style="list-style-type: none"> 1. Command parameters increases to ~1KB 2. Modify bit 0x0004[6] to turn on/off Parallel port properly with register 0x0032[15:14] 3. Remove PCIk toggle requirement when RefClk is used 4. No need to toggle RefClk to get out of reset 5. Add register bit 0x0032[0] to control Hsync Polarity 6. Update Revision ID to 0x01
Rev 0.2	04/19/2012	<ol style="list-style-type: none"> 1. Rename Register 0x00E0 and its fields to reflect the meaning better 2. Section4.3.3 modified to add step #12 for commands > 8 parameters 3. Update Figure 5-3, removing toggling requirement 4. Correct register 0x0030 typo to 0x0032 5. Update section 4.4.3 for proper stopping/starting parallel video stream sequence to prevent 768A from hanging 6. Replace TC358768 with TC358768A
Rev 0.3	07/01/2012	<ol style="list-style-type: none"> 1. Typo Correction 2. Update Register 0x00E0 field description 3. Long Command steps updated 4. Remove bit 0x0002[1], sleep bit 5. Update Registers 0x0140 – 0x0150 6. Update Table 5-1 to indicate registers' addressability 7. Remove Tentative
Rev 0.4	08/23/2012	<ol style="list-style-type: none"> 1. Update "RESTRICTIONS ON PRODUCT USE" page 2. Update I2C write/read access (sections 4.5.2/3)
Rev 0.5	09/12/2012	<ol style="list-style-type: none"> 1. Typo fixed 2. Correct step 3 in section 4.3.3 adding register 0x0022
Rev 0.6	10/16/2012	Add MIPI Tx D-PHY Timing
Rev 0.7	11/02/2012	Add typical power consumption for each power rail
Rev 0.8	1/15/2013	<ol style="list-style-type: none"> 1. Clarify Power On/Off sequence 2. Add Power Up/Down sequence 3. Remove RefClk toggles requirement if it is not used
Rev 0.9	2/15/2013	Add TC358778XBG for new package Add Package (80 ball, 7.0 x 7.0 mm, 0.65 mm pitch)
Rev 1.0	4/23/2013	<ol style="list-style-type: none"> 1. Update Table 9-7, min of Horizontal Sync Pulse Width, T_{HP} = 8 pixels 2. Change MIPI Copyright footer from 2005-2008 to 2005-2010.
Rev 1.1	5/28/2013	<ol style="list-style-type: none"> 1. Change I2C slave address for 778 from 0x0000_111x to 0x0001_110x 2. Keep I2C slave address for 768A as 0x0000_111x

1 Overview

The Parallel Port to MIPI DSI (TC358768AXBG/TC358778XBG) is a bridge device that converts RGB to DSI. All internal registers can be access through I2C or SPI.

Figure 1-1 System Overview with TC358768AXBG/TC358778XBG in RGB to DSI-TX

2 Features

Below are the main features supported by TC358768AXBG/TC358778XBG.

DSI-TX Interface

- ✧ MIPI DSI compliant (Version 1.02.00– June 28, 2010)
 - Support DSI Video Mode data transfer
 - DCS Command for panel register access
- ✧ Supports up to 1 Gbps per data lane
- ✧ Supports 1,2,3 or 4 data lanes
- ✧ Supports video data formats
 - RGB888/666/565

RGB Interface

- ✧ Supports data formats
 - 24-bit data bus
 - ✧ RGB888/666/565 data formats
- ✧ Up to 166 MHz input clock
- ✧ Support VSYNC/HSYNC polarity option (default LOW)
- ✧ Support DE polarity option (default High)

I2C/SPI Slave Interface (Option to select either I2C or SPI interface)

- ✧ I2C Interface (when CS=L)
 - Support for normal (100KHz), fast mode (400 KHz) and Special mode (1 MHz)
 - Configure all TC358768AXBG/TC358778XBG internal registers
 - Writing to DCS registers will trigger DCS Command transmits over DSI
- ✧ SPI interface (when CS =H)
 - SPI interface support for up to 25 MHz operation.
 - Configure all TC358768AXBG/TC358778XBG internal registers
 - Writing to DCS registers will trigger DCS Command transmits over DSI

GPIO signals

- ✧ 2 GPIO signals
 - Two GPIO signals can be configured as SPI signals (SPI_SS and SPI_MISO)
 - Or One GPIO signal can be configured as Interrupt output signal, INT.

System

- ✧ Clock and power management support to achieve low power states.

Power supply inputs

- ◊ Core and MIPI D-PHY: 1.2V
- ◊ I/O: 1.8V – 3.3V

Power Consumption

- ◊ WXGA @60fps: Pixel Clk: 74.25 MHz, DSIClk: 312 MHz → 66.7 mW
- ◊ 1080P @60fps: Pixel Clk: 148.5 MHz, DSIClk: 471 MHz → 91.4 mW

	VDDC	VDDIO	VDDMIPI	Total Power
	1.2V	3.3V	1.2V	
1080P Video	42.8mA	0.4mA	32.3mA	
	51.36mW	1.32mW	38.76mW	91.44 mW
WXGA Video	34.71A	0.167mA	20.36A	
	41.652W	0.551mW	24.432W	66.64 mW
Power Down w/o DCLK, RefClk	0.074mA	0.025mA	0.004mA	
	0.089mW	0.0825mW	0.0048mW	176.1 uW

- ◊ Power Down is Achieved by

3 External Pins

3.1 TC358768A pinout description

TC358768AXBG resides in BGA72 pin packages. The following table gives the signals of TC358768AXBG and their function.

Table 3-1 TC358768AXBG Functional Signal List

Group	Pin Name	I/O	Type	Initial	Function	Note
System: Reset & Clock (4)	RESX	I	Sch	-	System reset input, active low

Figure 3-2 TC358778XBG 80-Pin Layout (Top View)

4 System Overview

TC358768AXBG/TC358778XBG received the data/controls from RGB then transmits them out to MIPI DSI TX. Host uses I2C/SPI interface to configure all TC358768AXBG/TC358778XBG internal registers.

Figure 4-1TC358768AXBG/TC358778XBG Data/Controls Flow in RGB to DSI-TX

4.1 DSI TX Protocol

Table below shows all the data types that supported in TC358768AXBG/TC358778XBG.

Table 4-1 Supports Data Types

Data Type	Description	Packet Size
0x01	Sync Event, V Sync Start	Short
0x11	Sync Event, V Sync End	Short
0x21	Sync Event, H Sync Start	Short
0x31	Sync Event, H Sync End	Short
0x08	End of Transmission packet (EoTp)	Short
0x02	Color Mode (CM) Off Command	Short
0x12	Color Mode (CM) On Command	Short
0x22	Shut Down Peripheral Command	Short
0x32	Turn On Peripheral Command	Short
0x03	Generic Short WRITE, no parameters	Short
0x13	Generic Short WRITE, 1 parameter	Short
0x23	Generic Short WRITE, 2 parameters	Short
0x04	Generic READ, no parameters	Short
0x14	Generic READ, 1 parameter	Short
0x24	Generic READ, 2 parameters	Short
0x05	DCS Short WRITE, no parameters	Short
0x15	DCS Short WRITE, 1 parameter	Short
0x06	DCS READ, no parameters	Short
0x37	Set Maximum Return Packet Size	Short
0x29	Generic Long Write (Max 8 byte for register access)	Long
0x39	DCS Long Write (Max 8 byte for register access)	Long
0x0E	Packed Pixel Stream, 16-bit RGB, 5-6-5 Format	Long
0x1E	Packed Pixel Stream, 18-bit RGB, 6-6-6 Format	Long
0x2E	Loosely Packed Pixel Stream, 18-bit RGB, 6-6-6 Format	Long
0x3E	Packed Pixel Stream, 24-bit RGB, 8-8-8 Format	Long

4.1.1 Video Mode Transmission

In Video mode, TC358768AXBG/TC358778XBG transmits all video timing events and pixel data in proper sequence and time. Video timing events are transmitted in these DSI short packets: VSYNC Start, VSYNC End, HSYNC Start, and HSYNC End. They are multiplexed with null (or blank) packets (or transitioned to LP idle cycle) and pixel data packets in the DSI serial link such that their reception at the chip will reflect in signal transition on VSYNC and HSYNC at proper timing for the receiving display panel. Pixel data is expected to be transmitted using Pixel Stream packet types (Data Type ID = 0x0E, 0x1E, 0x2E or 0x3E.).

VSYNC Start, VSYNC End, HSYNC Start and HSYNC End are trigger by RGB VSYNC and HSYNC pulse. Refer to Figure 4-6 for more information.

Video Line byte count must be configs into Word Count Register 1 (WordCnt1) before starting transfer video over RGB.

4.1.2 Pixel Format

The chip supports RGB-565, RGB-666 packed or loose, and RGB-888 pixel formats in video data packets.

In video mode transmission, pixel format is differentiated by the data type ID in the header of pixel stream packets received. Data type ID must be configured into DSITX_DT register before starting video transmission.

4.2 DSI TX Video Packet Operation

Below describes the TC358768AXBG/TC358778XBG sequence for transmit out the video data ontoDSI TX.

- 1) Configures all registers.
- 2) Enable Parallel Input port.
- 3) Detects VSYNC transition
 - a. If detect VSYNC transition from HIGH to LOW. Transmits VSYNC Start packet.
 - b. Detect HSYNC pulse (generate Hsync Start, Hsync End packets accordingly)
 - c. If detect VSYNC transition from LOW to HIGH. Transmits VSYNC End packet. Go to step "4"
- 4) Detect HSYNC pulse (generate Hsync Start, Hsync End packets accordingly). Once detect DE transition from LOW to HIGH then go to step "5".
- 5) Wait for the Video buffer reaches the programmable "FIFO Level" go to step "6"
- 6) Transmits Video packet (one line) then go to step "7"
- 7) Detects HSYNC pulse (generate Hsync Start, Hsync End packets accordingly). If detect DE transition from LOW to HIGH then go to step "5"
 - a. If detect VSYNC transition from HIGH to LOW. Transmits VSYNC Start packet, go to step "3"

Note: Assume VSYNC/HSYNC are active LOW.

4.3 DSI TX Command Packet Operation

Below describes the TC358768AXBG/TC358778XBG sequence for transmitting out DSI, including DCS, Command over DSI TX. Host can use either I2C or SPI interface to access to TC358768AXBG registers.

By programming the following registers, TC358768AXBG/TC358778XBG will generate/transmit DSI command packets. ECC and CRC are generated and attached automatically by the hardware.

- DSICMD_TX (Register 0x0600)
 - Contains DSI Command Packet Start Transmit bit.
- DSICMD_TYPE (Register 0x0602)
 - Contains DSI(short or long) Command Packet Type
 - Contains DSI Packet Data ID
- DSICMD_WC (Register 0x0604)
 - Contains DSI Command Packet Word Count
- DSICMD_WD0, DSICMD_WD1, DSICMD_WD2, DSICMD_WD3 (0x0610 – 0x0616)
 - Contains DSI Command Packet Data Bytes (total 8 bytes)

4.3.1 TX ShortPacket (DCS) Write Command

The relationship/assembly of a short DSI packet respect to the DSICMD_** registers are illustrated in Figure 4-2. The command code, either DCS command or Panel specific command, is stored in Data Byte 0 while Data Byte1 contains either command parameter or “0x00”.

Figure 4-2 DSI Short Command Packet Assembly

The step-by-step procedure is listed below with two examples:

- 1 Set register DSICMD_TYPE[PkType] = 0x10 for DSI short packet.
- 2 Choose desired DCS Short Write Command in register DSICMD_TYPE[DATA_ID] = 0x05 or 0x15 for DCS Command without parameter or with 1 parameter, respectively.
- 3 Be sure to set 0x0000 in DSICMD_WC register.

- 4 Program DCS command code (as specified in MIPI DCS Command Spec in DSICMD_WD0[7:0].)
- 5 If DSICMD_TYPE[DATA_ID] = 0x15, set DCS Command Parameter in DSICMD_WD0[15:8]. Otherwise set “0x00” in DSICMD_WD0[15:8].
- 6 Set DSICMD_TX = 0x01 to start DCS Write Short packet.

Example1: TX DCS Short Command: Exit_Sleep_Mode (0x11), no parameter

0x0602 = 0x1005	(Short packet, Data ID = 0x05)
0x0604 = 0x0000	(WC1, WC0=0 for DSC short write)
0x0610 = 0x0011	(Data1= 0,DCS Command)
0x0600 = 0x0001	(Start transfer)

Example2: TX DCS Short Command: Set_Pixel_Format (0x3A), 1 parameter (RGB888)

0x0602 = 0x1015	(Short packet, Data ID = 0x15)
0x0604 = 0x0000	(WC1, WC0=0 for DSC short write)
0x0610 = 0x703A	(RGB888,DCS Command)
0x0600 = 0x0001	(Start transfer)

4.3.2 TX Long Packet Write Command (limited to 8-byte in length)

The relationship/assembly of a long DSI packet respect to the DSICMD_** registers are illustrated in Figure 4-3. The command code, either DCS command or Panel specific command, is stored in Data Byte 0 while Data Byte1 to Data 7contains either command parameters. The maximum word count for DSI Long Command is limited to 8 bytes. For a single byte command code, the maximum parameters length can be 7 bytes.

Figure 4-3 DSI Long Command Packet Assembly

The step-by-step procedure is listed below with an example:

- 1 Set register DSICMD_TYPE[PkType] = 0x40 for DSI long packet.
- 2 Choose desired DSI Long Write Packet/Command, ex, 0x19 for Generate Long Write Packet, in register DSICMD_TYPE[DATA_ID] field.
- 3 Set DSICMD_WCregister to the correct word count, number of data bytes in the packet.
- 4 Fill update to 8-bytes of data in registers DSICMD_WD0, 1, 2 & 3 in sequence.
- 5 For DCS Long Write Command, the command code should be set at register DSICMD_WD0[7:0].
- 6 Set DSICMD_TX = 0x01 to start DCS Write Short packet.

Example: TX Generic Long Write Packet with 4 bytes of Data: 0x12, 0x34, 0x56, 0x78

0x0602 = 0x4029	(DSI Long Command/Packet, Data ID = 0x29)
0x0604 = 0x0004	(WC1,WC0)
0x0610 = 0x3412	(Data1,Data0)
0x0612 = 0x7856	(Data3,data2)
0x0600 = 0x0001	(Start transfer)

4.3.3 TX Long Packet Write Command (Up to 1024-byte in length)

In order to support user defined DCS commands, which require more than 7 bytes of parameters. TC358768A/TC358778 provides a method to use its video buffer to store the command and its parameters before sending out via DSI link.

- Since video buffer is used to store the command and its parameters, these long commands can only be issued when there is no video data being transferred.
- Please make sure the number of “command plus parameters” are in multiple of 4-byte, padding with “0x00” at the end to achieve this requirement.

The step-by-step procedure is listed below with an example:

- 1 0x0008 = 0x0001 (Use DataID specified in register 0x0050, Keep DSITx Disable)
- 2 0x0050 = 0x0039 (DataID = 0x39)
- 3 0x0022 = 0x000a (10 bytes, 1-byte command + 9-byte param, to be sent)
- 4 0x00e0 = 0x8000 (Enable Write into video buffer via I2C/SPI bus)
- 5 0x00e8 = 0x00d5 (Command = 0xd5, 1st param = 0x00)
- 6 0x00e8 = 0x7666 (2nd param = 0x66, 3rd param = 0x76)
- 7 0x00e8 = 0x0204 (4th param = 0x04, 5th param = 0x02)

- 8 0x00e8 = 0x4202 (6th param = 0x02, 7th param = 0x42)
- 9 0x00e8 = 0x0302 (8th param = 0x02, 9th param = 0x03)
- 10 0x00e8 = 0x0000 (Padding to make 12 bytes total)
- 11 0x00e0 = 0xE000 (Start DSI Tx command transfer)
(wait for Command finishes by estimating the number of bytes to be transferred)
- 12 0x00e0 = 0x2000 (Keep Mask High to prevent short packets send out)
- 13 0x00e0 = 0x0000 (Stop DSI Tx command transfer)

4.3.4 TX (Short) Packet Read Command

All the DSI Read packet are short packets. After issuing any read command, TC358768A will automatically performs bus turn around and the data returned will be stored in register DSICMD_RXFIFO for Application Processor to read. DSICMD_RXFIFO is a 32 x 8 FIFO, which means TC35768 can accept up to 32 byte of data per DSI Read command. TC35768 is expected to send DSI “Set Maximum Return Packet Size” short packet (Data ID = 0x37) to the DSI Rx to indicate how many bytes it needs to read in the following read command(s). The sequences are:

- 1 Inform DSI Rx the desired bytes to read by sending “Maximum Return Packet Size” short packet
 - 0x0602 = 0x1037 (Short packet, Data ID = 0x37)
 - 0x0604 = 0x0000 (WC1,WC0=0 for Short Packet)
 - 0x0610 = 0x0008 (Read 8-byte of Data, 2 parameters)
 - 0x0600 = 0x0001 (Start transfer)
- 2 Issue a DCS Read Command get_power_mode (0x0A)
 - 0x0602 = 0x1006 (Short packet, Data ID = 0x06, DCS Read, no parameter)
 - 0x0604 = 0x0000 (WC1,WC0=0 for DSC Short Packet)
 - 0x0610 = 0x000A (Data1, DCS Command)
 - 0x0600 = 0x0001 (Start transfer)
- 3 TC35768 performs Bus Turn Around (BTA) automatically to let DSI Rx to send one byte of data.
 - a. The received data will be pushed into DSICMD_RXFIFO (0x0430), where Host can read the data from
 - b. Host can monitor registers bit RXFIFO_STATUS[5] when asserted data arrived.
 - c. Host needs to track the data which is read into DSICMD_RXFIFO if multiple read commands were issued before it fetch the data.

TC358768A/TC358778 does not extract data out of each LP packets received from DSIRx, a whole packet is stored into DSICMD_RXFIFO, packed into 32-bit boundary as shown in Figure 4-4 below. It is up to the Host to fetch and interpret the data.

Figure 4-4 DSICMD_RXFIFO Data Arrangement

4.4 Parallel Input (RGB)

4.4.1 Overview

24-bit parallel input interface is capable to transfer various types of data formats (RGB888/666/565). The signal connections for these types are shown in below Table.

Table 4-2 24-bit Unpacked Data bus

Data Type	Mode	Pin Usage	
		PD[23:0]	Comment
RGB888	0	{R[7:0],G[7:0],B[7:0]}	1 pixel/PClk
RGB888	1	{R[1:0]G[1:0],B[1:0],R[7:2],G[7:2],B[7:2]}	1 pixel/PClk
RGB666	0	{2'b0,R[5:0],2'b0,G[5:0],2'b0,B[5:0]}	1 pixel/PClk
RGB666	1	{6'b0,R[5:0],G[5:0],B[5:0]}	1 pixel/PClk
RGB565	0	{2'b0,R[4:0],3'b0,G[5:0],2'b0,B[4:0],1'b0}	1 pixel/PClk
RGB565	1	{3'b0,R[4:0],2'b0,G[5:0],3'b0,B[4:0]}	1 pixel/PClk
RGB565	2	{8'b0,R[4:0],G[5:0],B[4:0]}	1 pixel/PClk

The Parallel Input controller received the video data from external RGB transmitter. It then packed these into 32-bit data format then transfers the packed data into the Video buffer.

Parallel Input controller is operated with PCLK only. All asynchronous logic is handled inside Video buffer Controller

4.4.2 Timing Diagrams for Video signals (Vsync and Hsync)

Below Figures show the timing relationship between HSYNC, VSYNC, DE and DSI-TX. Please note the leading edge of first Hsync is expected to lineup with that of VSync's.

Figure 4-5 VSYNC/HSYNC/DE Timing Diagram – Pulse mode

Figure 4-6 VSYNC/HSYNC/DE Timing Diagram – Event mode

4.4.3 Enable and Disable Parallel Input (Video)

While TC358768A/TC358778 is running, the following procedures need to perform in order to stop and re-start video operation without reset. Otherwise, TC358768A/TC358778 might be hung, which needs to be reset.

Three registers bits, 0x0032[15] (FrmStop), 0x0032[14] (RstPtr) and 0x0004[6] (PP_En) needs to be programmed sequentially.

To stop TC358768A/TC358778 (video):

- 1 Set FrmStop to 1'b1, wait for at least one frame time for TC358768A to stop properly
- 2 Clear PP_En to 1'b0
- 3 Set RstPtr to 1'b1
- 4 Stop Video to TC358768A (optional)

To re-start TC358768A/TC358778 (video):

- 1 Start Video to TC358768A
- 2 Clear RstPtr and FrmStop to 1'b0
- 3 Set PP_En to 1'b1

4.4.4 Power Down and Up Sequence

The following sequences are suggested in order for TC358768A/TC358778 to achieve minimum power consumption state when video transfer is not required.

To Power Down TC358768A/TC358778 to Lowest Power Consumption State:

1. Disable TC358768A Parallel Input as shown in section 4.4.3
2. Stop DSI continuous clock (if continuous clock is selected)
0x0238 = 0x0000
0x023A = 0x0000
3. Set to LP mode
0x0500 = 0x0080
0x0502 = 0xC300
4. Disable D-PHY
0x0140 = 0x0001
0x0142 = 0x0000
0x0144 = 0x0001
0x0146 = 0x0000
0x0148 = 0x0001
0x014A = 0x0000
0x014C = 0x0001
0x014E = 0x0000
0x0150 = 0x0001
0x0152 = 0x0000
5. Disable PLL
0x0018 = 0x0603

- 0x0018 = 0x0600
6. Stop RGB input including PCLK.
7. Stop REFCLK.

To Power Up/Back TC358768A/TC358778 to Normal Operation State:

1. Start input REFCLK, PCLK and RGB
2. Enable PLL
0x0018 = 0x0603
Wait more than 1ms (for PLL to lock)
0x0018 = 0x0613
3. Power On LCD(If LCD is powered off) before enabling D-PHY
4. Enable D-PHY (HiZ->LP11)
0x0140 = 0x0000
0x0142 = 0x0000
0x0144 = 0x0000
0x0146 = 0x0000
0x0148 = 0x0000
0x014A = 0x0000
0x014C = 0x0000
0x014E = 0x0000
0x0150 = 0x0000
0x0152 = 0x0000
5. Set DSI clock to continuous mode (If continuous mode is needed)
0x0238 = 0x0001
0x023A = 0x0000
6. Send exit_sleep_command if needed. (This depends on LCD spec)
7. Set to HS mode
0x0500 = 0x0087 (lane setting depends on how many lane is used)
0x0502 = 0xA300
8. Enable TC358768A Parallel Input as shown in section 4.4.3

4.5 I2C Slave Interface

4.5.1 Overview

TC358768AXBG/TC358778XBG supports an I2C slave function. The I2C module supports the following features:

- Fail safe I2C pad operation
- Up to 400 KHz fast mode operation or 1MHz for special mode operation.
- Supports 7 bit slave addresses recognition
 - For TC358768AXBG: slave address=7'b0000_111X
 - For TC358778XBG: slave address=7'b0001_110X
- No support for general call address
- Supports 16 bit index value for TC358768AXBG/TC358778XBG I2C slave access

The I2C slave function supports a fixed slave address only and does not support general call address. The I2C slave function does not require any programmable configuration parameters.

4.5.2 I2C Write Access

Registers in TC358768AXBG/TC358778XBG are 16-bit aligned. This implies that I2C accesses to registers are recommended to be done on 16-bit boundaries. Note that data transferred on the I2C bus is sent MSB first. For 32-bit addressable registers listed in Table 6-1, two back-to-back 16-bit write operations (lower address one first) are necessary in order to update the 32-bit registers.

Alternatively, for 32-bit registers can be written in 32-bit in one access with byte order shown below.

Figure 4-7 32-bit Write Transfers Byte Order

4.5.3 I2C Read Access

Registers in TC358768AXBG/TC358778XBG are 16 bit aligned. This implies that I2C accesses to registers should always be done on 16 bit boundaries, Figure 4-8. Note that data transferred on the I2C bus is sent MSB first. For continuously reading, a 32-bit register data byte order is shown in Figure 4-9 below.

Figure 4-8 I2C Read Transfers over I2C Bus

Figure 4-9 I2C 32-bit Read Transfers Byte Order

4.6 SPI Slave Interface

The TC358768AXBG/TC358778XBG Bridge Chip incorporates a SPI Slave Interface port which Host can drive to configure registers in the chip.

The following features are supported:

- Slave select pin supported
- Clock Polarity and Phase selectable
- Transfer Frame size of 32 bits
- Slave speed is up to 25 MHz
- Supports 16 bit index value for TC358768AXBG/TC358778XBGSPI slave access

The basic operation of SPI interface is shown below where the standard 4-wire interface is used for transactions between the Host (SPI Master) and TC358768AXBG/TC358778XBG (SPI Slave).

The Host asserts (active low) the Slave Select signal (SPI_SS) when it wants to initiate a read or write transaction. This is followed by the Host sending 32 pulses on the SPI Clock signal (SPI_SCK). In this spec., the bit slots are assumed numbered 31 to 0 from left to right.

Once the intended 16 bits (for TC358768AXBG register address and command) and the additional data bits have been transferred, the Host de-asserts the Slave Select signal (SPI_SS) to indicate end of frame transfer.

This is shown in a simplistic way in the figure below (16bits transfer size shown in the figure).

Figure 4-10 SPI basic operation

4.6.1 Clocking Modes

The SPI slave function supports one clocking mode which shown below.

Table 4-3 SPI Clocking modes

Mode	SPOL	SPHA	Drive Edge	Sample Edge	Comments
3	1	1	negedge	posedge	Master/Slave drive first data on first active clock edge

4.6.1.1 Timing Diagram

In this transfer format, the first bit value is captured on the second clock edge. This will be on a rising edge. The levels on the MOSI and MISO signals always change with the inactive clock edges on SCLK. The inactive clock edge will be the falling edge. It will idle high.

Figure 4-11 SPI Transfer

4.6.1.2 Providing Register Address over SPI Interface

The SPI transactions are performed in 32 bits wide frames. The SPI master drives the command and address of the TC358768AXBG/TC358778 register to be accessed. The first 15 bits provide the register address bits 15 to 1. The 16th bit of a frame is the command: 0=Write / 1=Read. Meaning of rest of the bits is based on transaction type. This frame structure is shown in the figure below for a write transaction.

Figure 4-12 Register Write Transfer over SPI (transfer size=32 bits)

CMD = Command: 1=Read / 0=Write

SPI slave function supports random write and read accesses.

4.6.1.3 SPI Write Access Translation

Registers in TC358768AXBG/TC358778 are 16 bit aligned. This implies that SPI accesses to registers should always be done on 16 bit boundaries. The SPI slave will update an internal 16-bit write data register indexed by the address in the SPI frame. The data in bit slots 15 to 0 (after the first 16 bits of address and command) on MOSI line is used as the write data for these writes. Write access to TC358768AXBG/TC358778 registers over the register interface is performed when a frame transfer is completed with command bit set to 0. During the write transaction, the data on the MISO line is not related to the write transaction. How to handle the data on MISO line during write transactions is discussed more in section on full-duplex mode.

Figure 4-13 Register Write Transfer over SPI (transfer size=32 bits)

4.6.1.4 SPI Read Access Translation

Registers in TC358768AXBG/TC358778 are 16 bit aligned. This implies that SPI accesses to registers should always be done on 16 bit boundaries. The SPI slave will access an internal 16-bit data register indexed by the address in the SPI frame.

Read access to TC358768AXBG/TC358778 registers is completed in two frames. The first frame is similar to a write frame (as shown above) but with the 16 bits of data on MOSI line ignored by TC358768AXBG/TC358778XBG. This step provides the 15 bits index address of the TC358768AXBG/TC358778XBG register to be accessed. The only difference in this step from Write frame is that the command bit is set to 1 (Read command). During the second frame period, the TC358768AXBG/TC358778XBG stuffs the read data into the bit slots 15 to 0 based on the data from the TC358768AXBG/TC358778XBG register indexed by the read command address in the first frame as shown below. Handling of MISO line during first frame period and MOSI line during the second frame period is discussed further in full-duplex mode section.

Figure 4-14 Register Read (Normal) Transfer over SPI (transfer size=32 bits)

4.6.2 Full Duplex

All above transactions are considered as full duplex by TC358768AXBG/TC358778XBG by default. During any frame, TC358768AXBG/TC358778XBG inserts the data from the TC358768AXBG/TC358778XBG register that was last addressed by the read command from the SPI master into the bit slots 15 to 0 of the frame on MISO line. During any frame, the bits on the MOSI line bit slots 31 to 17 are considered as the address with the bit slot 16 providing the command. Data on MOSI line during bit slots 15 to 0 are used as write data.

The data on MISO line during bit slots 15 to 0 always corresponds to the previous frame's read command and can be ignored by the SPI Master if the previous frame command was a read command.

The data on MOSI line during bit slots 31 to 17 always provides the address for the TC358768AXBG/TC358778XBG register for the current frame command.

The data on MOSI line during bit slots 15 to 0 will always be written into the TC358768AXBG/TC358778XBG register addressed by current frame's address bits (bit slots 31 to 17) if the command in the current frame is a write command.

Four scenarios are possible for back to back transactions as explained below.

4.6.2.1 Back-to-back writes

In this case, the data on the MOSI line is always valid during both back-2-back frames and used for TC358768AXBG/TC358778XBG register writes. The data on the MISO line in first frame might correspond to a read command issued in the previous frame. Data on the MISO line in 2nd frame is redundant (corresponds to the TC358768AXBG/TC358778XBG register addressed by the last read command some frames ago).

Figure 4-15 Back-2-Back Write Transfers over SPI

4.6.2.2 Back-2-back reads

In this case, the data on the MOSI line is always valid only during first 16 bits (bit slots 31 to 16) in both back-2-back frames and used for TC358768AXBG/TC358778XBG register reads. The data on the MISO line in first frame might correspond to a read command issued in the previous frame. Data on the MISO line in 2nd frame corresponds to the TC358768AXBG/TC358778XBG register addressed by the read command in 1st frame. The read data corresponding to the register addressed by the read command in 2nd frame shall be available in the next (3rd) frame on MISO line.

Figure 4-16 Back-2-Back Read Transfers over SPI

4.6.2.3 Write-after-Read

In this case, the handling of data on MISO and MOSI lines during first frame is similar to the “Back-to-Back reads” case. Data on the MOSI line during first 16 bits (bit slots 31 to 16) in 2nd frame provides the address and command for the write (write-after-read). Data on the MOSI line during bit slots 15 to 0 in 2nd frame provides the write data for the write command. Data on the MISO line in 2nd frame corresponds to the TC358768AXBG/TC358778XBG register addressed by the read command in 1st frame.

Figure 4-17 Write-after-Read Transfer over SPI

4.6.2.4 Read-after-Write

In this case, the handling of data on MISO and MOSI lines during first frame is similar to the “Back-to-Back writes” case. Data on the MOSI line during first 16 bits (bit slots 31 to 16) in 2nd frame provides the address and command for the read (read-after-write). Data on the MOSI line during bit slots 15 to 0 in 2nd frame is redundant. Data on the MISO line in 2nd frame is redundant. The read data corresponding to the register addressed by the read command in 2nd frame shall be available in the next (3rd) frame on MISO line.

Figure 4-18 Read-after-Write Transfer over SPI

4.6.2.5 NOP-after-Read

In this case, where there is a read alone followed by no more immediate request, the handling of data on MISO and MOSI lines during first frame is similar to the “Back-to-Back reads” case. Data on the MOSI line during first 16 bits (bit slots 31 to 16) in 2nd frame should contain all 1's to point to a dummy address for SPI and command for the write. Data on the MOSI line during bit slots 15 to 0 in 2nd frame is redundant. Data on the MISO line in 2nd frame corresponds to the TC358768AXBG/TC358778XBG register addressed by the read command in 1st frame. The write on MOSI line in 2nd frame points to a dummy address (all 1's) and so is redundant.

Figure 4-19 NOP-after-Read Transfer over SPI

5 Clock and System

The clock generation unit (CG) makes use of a single PLL. PLL Clock output frequency is same as DSITX Bit clock frequency. DSITX Byte clock will be used for DSITX controller and Video Buffer controller. PCLK input will be used for Parallel port input controller. The rest modules use either REFCLK or PCLK/4.

PLL uses either an external input clock REFCLK (6MHz to 40 MHz) or PCLK/4 to generate PLL RefClk as shown in Figure 5-1. After reset, if REFCLK is not present on the system, automatically TC358768AXBG/TC358778XBG will select PCLK/4 as the clock source.

Figure 5-1 D-PHY PLL with its Clock Sources

5.1.1 Example of PLL Generated Clock Frequency

The possible clock frequencies generated from the PLL are achieved by varying the values in registers PLLFB and PLLDiv.

$$pll_clk = RefClk * [(FBD + 1) / (PRD + 1)] * [1 / (2^{FRS})]$$

or

$$pll_clk = (PCLK/4) * [(FBD + 1) / (PRD + 1)] * [1 / (2^{FRS})]$$

Table 5-1 provides possible frequencies that may be used in TC358768AXBG/TC358778XBG.

Table 5-1 Possible PLL parameters

Reference clock (MHz) (REFCLK or PCLK/4)	FBD	PRD	FRS	pll_clk (MHz)
16.6	255	7	1	265.60
	319	5	2	221.33
	319	6	2	189.71
	319	7	2	166.00

Table 5-2 Controllers' Operating Frequency

Controllers	Operating Frequency		Source
	min (MHz)	max (MHz)	
VB controller (Write port)	10	166	Input PCLK
VB controller (Read port)	---	125	DSI Byte clock (PLL)
Parallel Input controller	---	166	Input PCLK
SPI/I2C controller	6	40	Input REFCLK
Register module	6	40	Input REFCLK

5.1.2 TC358768AXBG/TC358778XBG Power On Procedure

The following sequence should happen before TC358768AXBG/TC358778XBG is able to operate properly:

1. Provide voltage and clock sources to TC358768AXBG/TC358778XBG.
2. For voltage source, it is desired to turn on core power (1.2) source first, then Analog PHY and IO power as shown in Figure 5-2 Power On Sequence.
3. RefClk, PClk/4, clock source can be from 6 MHz to 40 MHz.
4. The timing parameters for Figure 5-2 are tabulated in Table 5-3.

Figure 5-2 Power On Sequence with External RefClk Running

Figure 5-3 Power On Sequence without External RefClk Running

Table 5-3 Power On Sequence Timing

Parameters	Description	Min.	Typ.	Max.	Units
RefClk	Reference clock frequency	6	---	40	MHz
t_1	VDD_MIPIon delay from VDDC.	0	---	10	msec
t_2	VDDIOon delay from VDDC	0	---	10	msec
t_{RSTON}	RESET width period	200	---	---	nsec
$t_{CORERDY}$	Period after reset de-assertion when TC358768AXBG/TC358778XBG clocks are stable (Dependent on REFCLK frequency)	.7	---	1	msec

5.1.3 TC358768AXBG/TC358778XBG Power Off Procedure

Figure 5-4 Power Off Sequence

Table 5-4 Power Off Sequence Timing

Parameters	Description	Min.	Typ.	Max.	Units
t_1	VDD_MIPI off delay from VDDIOoff	0	---	10	msec
t_2	VDDC off delay from VDD_MIPI off	0	---	10	msec

6 RegFile Block

Host accesses TC358768AXBG/TC358778XBG RegFile block to read status and/or write control registers through the I2C or SPI slave interface.

Registers in Group Global and DSITX_CTL (Table 6-1) can be accessed as 16-bit registers. The others have to be written as 32-bit registers, even if the upper 16-bits are all zeros.

6.1 Register Map

The control and status registers in TC358768AXBG/TC358778XBG is provided in Table 6-1.

Table 6-1 Register Map

Group	Address	Register	Description
Global (16-bit addressable)	0x0000	ChipID	TC358768AXBG/TC358778XBG Chip and Revision ID
	0x0002	SysCtl	System Control Register
	0x0004	ConfCtl	Configuration Control Register
	0x0006	VSDly	Video Delay Register
	0x0008	DataFmt	Data Format Control Register
	0x000E	GPIOEn	GPIO Enable Control Register
	0x0010	GPIODir	GPIO Pin Direction Control Register
	0x0012	GPIOIn	GPIO Input Pin Value
	0x0014	GPIOOut	GPIO Output Pin Value
	0x0016	PLLCtl0	PLL control Register 0
	0x0018	PLLCtl1	PLL control Register 1
	0x0022	CMDByte	Long Command Byte Count
	0x0032	PP_MISC	Parallel Input Port Miscellaneous Register
	0x0050	DSITX_DT	DSITX Data Type Register
	0x00F8	FIFOStatus	FIFO Underflow/Overflow Status
TX PHY (32-bit addressable)	0x0100	CLW_DPHYCONTTX	Clock Lane DPHY Tx Control register
	0x0104	D0W_DPHYCONTTX	Data Lane0 DPHY Tx Control register
	0x0108	D1W_DPHYCONTTX	Data Lane1 DPHY Tx Control register
	0x010C	D2W_DPHYCONTTX	Data Lane2 DPHY Tx Control register
	0x0110	D3W_DPHYCONTTX	Data Lane3 DPHY Tx Control register
	0x0114 – 0x013F	Reserved	
	0x0140	CLW_CNTRL	Clock Lane DPHY Control Register
	0x0144	D0W_CNTRL	Data Lane 0 DPHY Control Register
	0x0148	D1W_CNTRL	Data Lane 1 DPHY Control Register
	0x014C	D2W_CNTRL	Data Lane 2 DPHY Control Register
	0x0150	D3W_CNTRL	Data Lane 3 DPHY Control Register
TX PPI (32-bit addressable)	0x0200	Reserved	
	0x0204	STARTCNTRL	DSITX Start Control Register
	0x0208	STATUS	DSITX Status Register
	0x020C	Reserved	
	0x0210	LINEINITCNT	DSITX Line Initialization Control Register
	0x0214	LPTXTIMECNT	SYSLPTX Timing Generation Counter
	0x0218	TCLK_HEADERCNT	TCLK_ZERO and TCLK_PREPARE Counter
	0x021C	TCLK_TRAILCNT	TCLK_TRAIL Counter
	0x0220	THS_HEADERCNT	THS_ZERO and THS_PREPARE Counter
	0x0224	TWAKEUP	TWAKEUP Counter
	0x0228	TCLK_POSTCNT	TCLK_POST Counter
	0x022C	THS_TRAILCNT	THS_TRAIL Counter
	0x0230	HSTXVREGCNT	TX Voltage Regulator setup Wait Counter
	0x0234	HSTXVREGEN	Voltage regulator enable for HSTX Data Lanes

	0x0238	TXOPTIONCNTRL	TX Option Control
	0x023C	BTACNTRL1	BTA Control
TX CTRL (32-bit addressable)	0x0400- 0x0408	Reserved	
	0x040C	DSI_CONTROL	DSI Configuration Read Register
	0x0410	DSI_STATUS	DSI Status Register
	0x0414	DSI_INT	DSITX – Presents interrupts currently being held
	0x0418	DSI_INT_ENA	DSITX – Enables DSI_INT interrupt source
	0x0430	DSICMD_RXFIFO	DSI Command Read Data FIFO
	0x0434	DSI_ACKERR	DSITX – acknowledge error packet
	0x0438	DSI_ACKERR_INTENA	DSITX – acknowledge error packet interrupt enable
	0x043C	DSI_ACKERR_HALT	DSITX – stop on error bit set in the DSI_ACKERR register
	0x0440	DSI_RXERR	DSITX – internal error while receiving by the previous BTA
	0x0444	DSI_RXERR_INTENA	DSITX – interrupt enable bits of the DSI_RXERR register
	0x0448	DSI_RXERR_HALT	DSITX – stop on error bit set in the DSI_RXERR register
	0x044C	DSI_ERR	DSITX – transfer general errors
	0x0450	DSI_ERR_INTENA	DSITX – interrupt enable bits of the DSI_ERR register
	0x0454	DSI_ERR_HALT	DSITX – stop on error bit set in the DSI_ERR register
	0x0500	DSI_CONFW	DSI TX Configure Write Register
	0x0504	DSI_RESET	DSITX – reset he module and the Receive FIFO content
	0x050C	DSI_INT_CLR	DSITX – Clears particular bits of the DSI_INT register
	0x0518	DSI_START	DSI – Starts DSITX operation
DSITX CTRL(16-bit addressable)	0x0600	DSICMD_TX	DSI Command Packet Start register
	0x0602	DSICMD_TYPE	DSI Command Packet Type register
	0x0604	DSICMD_WC	DSI Command Packet Word Count
	0x0610	DSICMD_WD0	DSI Command Packet Data register 0
	0x0612	DSICMD_WD1	DSI Command Packet Data register 1
	0x0614	DSICMD_WD2	DSI Command Packet Data register 2
	0x0616	DSICMD_WD3	DSI Command Packet Data register 3
	0x0620	DSI_EVENT	DSI Hsync Event Mode
	0x0622	DSI_VSW	DSI Vsync Width register
	0x0624	DSI_VBPR	DSI Vsync Back Porch lines register
Debug (16-bit addressable)	0x0626	DSI_VACT	DSI Vsync Active lines register
	0x0628	DSI_HSW	DSI Hsync Width register
	0x062A	DSI_HBPR	DSI Hsync Back Porch register
	0x062C	DSI_HACT	DSI Hsync Active Pixels register
	0x00e0	VBufCtl	VBuffer Control (ColorBar, or Command) Register
	0x00e2	DBG_WIDTH	Debug Setting for Line Width
	0x00e4	DBG_VBlank	Debug Setting for Vertical Blank lines
	0x00e8	DBG_Data	Debug Setting for Data Written into FIFO

6.2 Register Description

The following sections provide a detailed description of the registers.

6.2.1 Chip and Revision ID (ChipID: 0x0000)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	ChipID							
Type	RO							
Default	0x44							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	RevID							
Type	RO							
Default	0x01							

Table 6-2 Chip and Revision ID

Register Field	Bit	Default	Description
ChipID	[15:8]	0x44	Chip ID Chip ID assigned for this device by Toshiba.
RevID	[7:0]	0x01	Revision ID Revision ID for this device assigned by Toshiba.

6.2.2 System Control Register (SysCtl:0x0002)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved							
Type	RO							
Default	0x0							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	Reserved							
Type	RO							
Default	0x0							

Table 6-3 System Control Register

Register Field	Bit	Default	Description
Reserved	[15:1]	0x0	
SReset	0	0x0	Software Reset (Active high) This bit is set to force TC358768AXBG/TC358778XBG logic to reset state except all configuration registers content (regFile) and I2C slave module. 0: Normal operation 1: Reset operation Software needs to clear SReset when set.

6.2.3 Input Control Register (InputCtl: 0x0004)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved		INTEn2	Reserved		PDataF		
Type	RO		R/W	RO		R/W		
Default	0x0		0x0	0x0		0x0		
Bit	B7	B6	B5	B4	B3	B2	B1	B0

Reserved	[12:10]	0x0	Reserved
PDataF	[9:8]	0x0	Parallel Data Format Option 2'b00: Mode 0 2'b01: Mode 1 2'b10: Mode 2 2'b11: Reserved Note: See Table 4-2 for more information
Reserved	7	0x0	Reserved
PPEn	6	0x0	Parallel Port Enable 0: Parallel Port Disable 1: Parallel Port Enable
VsyncP	5	0x0	VSync Polarity Control 0: Active low 1: Active high Note: Hsync Polarity is defined in register bit 0x0032[0]
DEP	4	0x0	DE Polarity Control 0: Active high 1: Active low
Reserved	3	0x0	Reserved
Auto	2	0x1	I2C slave index increment 0: I2C address index does not increment on every data byte transfer 1: I2C address index increments on every data byte transfer Note: For I2C interface only
Reserved	[1:0]	0x0	Reserved

Note: All Reserved bits must program "0"

6.2.4 VSDly Register (VSDly: 0x0006)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved						VSDly[9:8]	
Type	RO						R/W	
Default	0x0						0x0	
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	VSDly[7:0]							
Type	R/W							
Default	0x1							

Table 6-5 VSDly Register

Register Field	Bit	Default	Description
----------------	-----	---------	-------------

Register Field	Bit	Default	Description
Reserved	[15:10]	0x0	Reserved
VSDly	[9:0]	0x1	V/HSync Delay Value This field determines Video Starts. After detecting VSync/HSync at parallel inputs, DSI Tx waits for the delay (counted in ByteClk) plus ~40 cycles (internal latency delay) before sending out VSS/HSS. Note: If this value is set too small, the chip will wait for data available in the video buffer before starting video output.

6.2.5 Data Format Control Register (DataFmt: 0x0008)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved							
Type	RO							
Default	0x0							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	PDFormat				spmode_en	rdswap_en	dsitx_en	txdt_en
Type	R/W				R/W	R/W	R/W	R/W
Default	0x0				0x0	0x0	0x0	0x0

Table 6-6 Data Format Control Register

Register Field	Bit	Default	Description
Resserved	[15:8]	0x0	Reserved
PDFormat	[7:4]	0x0	Peripheral Data Format 0000: User Define 0001: Reserved 0010: Reserved 0011: RGB888 0100: RGB666 0101: RGB565 0110: Reserved 0111: Reserved 1000: Reserved 1001: Reserved 1010: Reserved 1011 – 1111: Reserved Notes: This field used for parallel input port packing logic
spmode_en	[3]	0x0	Special mode enable 0: Normal 1: RGB666: select Loosely pack Note: Only valid when rdswap_en=1
rdswap_en	[2]	0x0	RGB Swap R & B enable Note: Must program to “1”
dsitx_en	[1]	0x0	DSITX i/f enable 0: Disable 1: Enable
txdt_en	[0]	0x0	DSITX Data Type ID enable

Register Field	Bit	Default	Description
			Must program to “1” DSITX: Use Data Type ID defined in DSITX_DT register

6.2.6 GPIO Enable Register (GPIOEn: 0x000E)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	GPIOEn[10:3]							
type	R/W							
Default	0x0							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	Reserved							
type	RO							
Default	0x0							

Table 6-7 GPIO Direction Register

Register Field	Bit	Default	Description
GPIOEn	[15:8]	0x0	GPIO Enable 0:Disable (GPIOx function depend on mode of operation) 1: Enable (GPIOx function depend on GPIODir)
Resserved	[7:0]	0x0	Reserved

6.2.7 GPIO Direction Register (GPIODir: 0x0010)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	GPIODir[10:3]							
type	R/W							
Default	0xFF							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	Reserved				GPIODir[2:1]		Reserved	
type	R/W				R/W		R/W	
Default	0x1F				0x3		0x1	

Table 6-8 GPIO Direction Register

Register Field	Bit	Default	Description
GPIODir	[15:8]	0x0	GPIO[10:3] Pin Direction
Reserved	[7:3]	0x1F	Do not change default value
GPIODir	[2:1]	0x3	GPIO[2:1] Pin Direction 0:GPIO Pin is set to Output Mode 1: GPIO Pin is set to Input Mode
Resserved	[0]	0x1	Do not change default value

6.2.8 GPIO Pin Value Register (GPIOPin: 0x0012)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	GPIOIn[10:3]							
type	RO							
Default	0x??							
Bit	B7	B6	B5	B4	B3	B2	B1	B0

6.2.10 PLL Control Register 0 (PLLCtl0: 0x0016)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	PLL_PRD					Reserved		PLL_FBD[8]
Type	R/W					RO		R/W
Default	0x4					0x00		0x0
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	PLL_FBD[7:0]							
Type	R/W							
Default	0x63							

Table 6-11 PLL Control Register 0

Register Field	Bit	Default	Description
PLL_PRD	[15:12]	0x4	Input divider setting Division ratio = (PRD3..0) + 1
Reserved	[11:9]	0x0	
PLL_FBD	[8:0]	0x063	Feedback divider setting Division ratio = (FBD8...0) + 1

6.2.11 PLL Control Register 1 (PLLCtl1: 0x0018)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved					PLL_FRS	PLL_LBWS	
Type	RO					R/W	R/W	
Default	0x0					0x1	0x2	
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	Revsd	LFBREN	BYPCKEN	CKEN	Reserved	RESETB	PLL_EN	
Type	RO	R/W	R/W	R/W	RO	R/W	R/W	
Default	0x0	0x0	0x0	0x0	0x0	0x0	0x0	

Table 6-12 PLL Control Register 1

Register Field	Bit	Default	Description
Reserved	[15:12]	0x0	
PLL_FRS	[11:10]	0x1	Frequency range setting (post divider) for HSCK frequency 2'b00: 500MHz – 1GHz HSCK frequency 2'b01: 250MHz – 500MHz HSCK frequency 2'b10: 125 MHz – 250MHz HSCK frequency 2'b11: 62.5MHz – 125MHz HSCK frequency
PLL_LBWS	[9:8]	0x2	Loop bandwidth setting 2'b00: 25% of maximum loop bandwidth 2'b01: 33% of maximum loop bandwidth 2'b10: 50% of maximum loop bandwidth (default) 2'b11: maximum loop bandwidth
Reserved	[7]	0x0	
PLL_LFBREN	[6]	0x0	Lower Frequency Bound Removal Enable 1'b0: REFCLK toggling → normal operation, REFCLK stops → no oscillation 1'b1: REFCLK toggling → normal operation, REFLCK stops → free running PLL
PLL_BYPCKEN	[5]	0x0	Bypass clock enable 1'b0: Normal operation 1'b1: bypass mode, REFCLK is used instead of PLL_VCO output
PLL_CKEN	[4]	0x0	Clock enable 1'b0: clocks switched off (output LOW) 1'b1: clocks switched on
Reserved	[3:2]	0x0	
PLL_RESETB	[1]	0x0	PLL Reset 1'b0: Reset 1'b1: Normal operation
PLL_EN	[0]	0x0	PLL Enable

			1'b0: PLL off 1'b1: PLL on
--	--	--	-------------------------------

6.2.12 DSI Command Byte Count Register (CMDByte: 0x0022)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	CMDCnt[15:8]							
Type	R/W							
Default	0x01							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	CMDCnt[7:0]							
Type	R/W							
Default	0x00							

Table 6-13 Command Byte Count Register

Register Field	Bit	Description
CMDCnt	[15:0]	Command Byte Count Defined total number of byte for a DSI command when using VBuf, as described in section 4.3.3

6.2.13 Parallel In Miscellaneous Register (PP_MISC: 0x0032)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	FrmStop	RstPtr	Reserved					
Type	R/W	R/W	RO					
Default	0x0	0x0	0x00					
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	Reserved						HsyncP	
Type	RO						R/W	
Default	0x00						0	

Table 6-14 DSI TX Data Type Register

Register Field	Bit	Default	Description
FrmStop	15	0x0	Frame Stop When this bit is asserted, TC358768A/TC358778 will stop outputting at the next Vsync
RstPtr	14	0x0	Reset Pointers When this bit is asserted, TC358768A/TC358778 resets its write/read pointers to Video Buffer
Reserved	[13:1]	0x00	
HsyncP	0	0x0	Hsync Polarity Control 0: Active low 1: Active high

Please refer to section 4.4.3 for the usage of bits [15:14].

6.2.14 DSI TXData Type Register (DSITX_DT: 0x0050)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved							
Type	RO							
Default	0x00							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	dsitx_dt[7:0]							
Type	R/W							
Default	0x30							

Table 6-15 DSITX Data Type Register

Register Field	Bit	Default	Description					
dsitx_dt	[7:0]	0x30	DSITX Data Type ID This field uses for DSITX Data Type ID when txdt_en = 1;					

6.2.15 FIFO Status Register (FIFOSTATUS: 0x00F8)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved							
Type	RO							
Default	0x00							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	Reserved						Vb_uflow	Vb_oflow
Type	RO						RO	RO
Default	0x00						0x0	0x0

Table 6-16 FIFO Status Register

Register Field	Bit	Default	Description					
Reserved	[15:2]							
vb_uflow	1	0	VB Under Flow Status 0: Normal 1: Under flow Read this register will clear the status					
vb_oflow	0	0	VB Over Flow Status 0: Normal 1: Over flow Read this register will clear the status					

6.2.16 Clock Lane DPHY TX Control register (CLW_DPHYCONTTX: 0x0100)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved						CLW_CAP1	CLW_CAP0
Type	RO	RO	RO	RO	RO	RO	R/W	R/W
Default	0	0	0	0	0	0	1	0
Bit	B7	B6	B5	B4	B3	B2	B1	B0

Name	DLYCNTR L3	DLYCNTR L2	DLYCNTRL 1	DLYCNT RL0	Reserved		CLW_LPTXCU RR1EN	CLW_LPTX CURR0EN
Type	R/W	R/W	R/W	R/W	RO	RO	R/W	R/W
Default	0	0	0	0	0	0	1	0

Table 6-17 Clock Lane DPHY TX Control register

Register Field	Bit	Default	Description
Reserved	[31:10]	0x0	
CLW_CAP1	[9]	0x1	Selection bit 1 of different HSTX output capacitors for Clock Lane
CLW_CAP0	[8]	0x0	Selection bit 0 of different HSTX output capacitors for Clock Lane (CAP1,CAP0): = (00): 0 [pF] (CAP1,CAP0): = (01): 2.8 [pF] (CAP1,CAP0): = (10): 3.2 [pF] (CAP1,CAP0): = (11): 3.6 [pF]
DLYCNTRL[3:0]	[7:4]	0x0	Tuning of transmit window position. The High Speed Clock output can be delayed according to the setting. The recommended value is determined by evaluating the LSI in which this module is implemented. Typical delay for rising/falling edge is about DLYCNTRL x 24ps/27ps. Rising edge : DLYCNTRL x 24ps, Falling edge : DLYCNTRL x 27ps.
Reserved	[3:2]	0x0	
CLW_LPTXCURR1EN	[1]	0x1	Selection bit-1 for LPTX output current (TRLP/TFLP tuning) for clock Lane.
CLW_LPTXCURROEN	[0]	0x0	Selection bit-0 for LPTX output current (TRLP/TFLP tuning) for clock Lane. 00: no additional output current 01: 25% additional output current 10: 25% additional output current 11: 50% additional output current The default value is "10". However, if "00" is set, the rise/fall time will become later and if "11" is set, the rise/fall time will become earlier.

6.2.17 Data Lane 0 DPHY TX Control register (D0W_DPHYCONTX:0x0104)

Default	0x20							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	LINEINITCNT[7:0]							
Type	R/W							
Default	0x8E							

Table 6-29 LINEINITCNT

Register Field	Bit	Default	Description
Reserved	[31:16]		
LINEINITCNT	[15:0]	0x208e	<p>Line Initialization Wait Counter This counter is used for line initialization. Set this register before setting [STARTCNTRL].START = 1. MIPI specification requires that the slave device needs to observe LP-11 for 100 us and ignore the received data before the period at initialization time. The count value depends on HFCLK and the value needs to be set to achieve more than 100 us. The counter starts after the START bit of the STARTCNTRL register is set. The Master device needs to output LP-11 for 100 us in order for the slave device to observe LP-11 for the period. For example, in order to set 100 us when the period of HFCLK is 12 ns, the counter value should be more than $100\text{ us} / 12\text{ ns} = 8333.3 = 0x208D$ (100 us / 12 ns). Default is 0x208E.</p>

6.2.29 LPTXTIMECNT (LPTXTIMECNT: 0x0214)

Bit	B15	B14	B13	B12	B11	B10	B9	B8

Type	RO	RO	RO	RO	RO	RO	RO	RO
Default	0	0	0	0	0	0	0	0

Table 6-40 DSI Configuration Register

Register Field	Bit	Default	Description
dsi_mode	15	0x1	DSI Mode Selection 0: DSI Mode 1: Reserved
PrToEn	13	0x1	PR_TO_EN 0: Disables the PR_TO timer. 1: Enables the PR_TO timer.
TaToEn	12	0x1	TA_TO_EN 0: Disables the TA_TO timer. 1: Enables the TA_TO timer.
LrxToEn	11	0x1	LPRX_TO_EN 0: Disables the LRX-H_TO timer. 1: Enables the LRX-H_TO timer.
HtxToEn	10	0x1	HSTX_TO_EN 0: Disables the HTX_TO timer. 1: Enables the HTX_TO timer.
CntDis	9	0x1	CONTENTION_DIS This bit disables contention detection.
EccDis	8	0x0	ECC_DISABLE This bit sets operation for when there are multiple-bit ECC errors in the received data. If multiple-bit ECC errors are detected, the ECC Error multi bit (bit 9) bit of

			<p>the DSI_RXERR register is asserted to "1" regardless of this bit's setting. In the case of ECC single-bit errors, the setting of this bit has no effect on the operation. Single-bit errors can be corrected, so the corrected data can be stored in the Receive FIFO regardless of this bit's setting. At this time, the ECC Error single bit (bit 8) bit of the DSI_RXERR is asserted to "1", and the settings of the DSI_ERR_HALT, and DSI_ERR_INTENA registers are valid.</p> <p>0: If there are multiple-bit ECC errors in the received data, subsequent processes including the fetching of data from the peripheral interface are terminated and wait for the LP Stop state. Loading to the Receive FIFO of the corresponding packets is not performed.</p> <p>1: Even if multiple-bit ECC errors are detected in the received data, subsequent processes including the fetching of data from the peripheral interface continue. Either the packet in which multiple bit ECC errors were detected is loaded into the Receive FIFO or the corresponding package waits for a valid Data Type. If the Data Type is invalid, the DSI Data Type no recognized (bit 11) bit of the DSI_RXERR register is set to "1" and the packet is discarded. If a valid Data Type is recognized, the packet is stored in the Receive FIFO. In the case of a long packet, processing continues up to the reception of the data payload.</p>
TxMd	7	0x0	<p>TXMODE</p> <p>0: Low power transfer is performed to Tx. 1: High-Speed data transfer is performed to Tx.</p>
CrcDis	6	0x0	<p>CRC_DISABLE</p> <p>Operation for when a CRC error was found in the received data is set. (For long packets only)</p> <p>0: CRC checking of received long packets is performed. If CRC errors exist in the received data, the CRC Error bit (bit 10) of the DSI_RXERR register is asserted to "1". Transfers to the Receive FIFO for the received data are performed.</p> <p>1: CRC checking of received long packets is not performed. Even if there are CRC errors in the received data, no notification is made to the DSI_RXERR register. The CRC errors are ignored and transfers to the Receive FIFO for the received data are performed.</p>
HsCkMd	5	0x0	<p>HSCLOCKMODE</p> <p>0: Operation is in the discontinuous clock mode. 1: Operation is in the continuous clock mode.</p>
Reserved	[4:3]	0x0	
NOL	[2:1]	0x0	<p>NOL</p> <p>This field specifies the number of HS lanes. This field is also used as the LP Lane Enable setting. Data Lane 0 is used as the Enable for LP communication and ULPS. Data Lane 1 or higher is used as the Enable for ULPS.</p> <p>This setting can only be made during initial setup or during reset.</p> <p>00: Only Data Lane 0 is used. 01: Data Lanes 0 and 1 are used. 10: Data Lanes from 0 to 2 are used. 11: Data Lanes 0 to 3 are used.</p>
EoTDis	0	0x0	<p>EOT_DISABLE</p> <p>0: The EOT packet is automatically granted at the end of HS transfer then is transmitted. 1: The EOT packet is not automatically granted at the end of HS transfer and is not transmitted.</p>

Only indirect writing, i.e. write to DSI_CONFW with [Addr] = 0x03.

6.2.41 DSI STATUS Register (DSI_STATUS:0x0410)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved						TxAct	RxAct
Type	RO						RO	RO
Default	0xX						0	0
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	RxAF	RxAE	RxEm	Reserved				Hlt
Type	RO	RO	RO	RO				RO
Default	0	1	0	0x0X				0

Table 6-41 DSI STATUS Register

Register Field	Bit	Default	Description
Reserved	[15:10]	X	
TxAct	9	0	Transmitter Active This bit indicates that the DSI-TX module is in the Transmit mode.
RxAct	8	0	Receiver Active This bit indicates that the DSI-TX module is in the Receive mode.
RxAF	7	0x0	FIFO_ALMOSTFULL This bit indicates that the Receive FIFO is almost full (has less than 3 empty slots).
RxAE	6	0x1	FIFO_ALMOSTEMPTY This bit indicates that the Receive FIFO is almost empty (has less than 2 entries).
RxEm	5	0x0	FIFO EMPTYn This bit indicates that the Receive FIFO is not empty.
Reserved	[4:1]	X	
Hlt	0	0	Halted The DSI-TX module is stopped by either an error or a pause request.

6.2.42 DSI_INT Register (DSI_INT: 0x0414)

Bit	B31	B30	B29	B28	B27	B26	B25	B24
Name	Reserved							
Type	RO							
Default	0x00							
Bit	B23	B22	B21	B20	B19	B18	B17	B16
Name	Reserved						IntAck	Reserved
Type	RO						RO	RO
Default	0x00						0	0x00
Bit	B15	B14	B13	B12	B11	B10	B9	B8

Name	Reserved							
Type	RO							
Default	0x00							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	Reserved				IntHlt	IntEr	IntRxEr	IntAkEr
Type	RO				RO	RO	RO	RO
Default	0x00				0	0	0	0

Table 6-42 DSI_INT Register

Register Field	Bit	Default	Description
Reserved	[31:19]	0x0	
IntAk	18	0x0	INT_ACK This bit indicates that the Acknowledge trigger has been received.
Reserved	[17:4]	0x0	
IntHlt	3	0x0	INT_HALTED The DSI-TX module was stopped by an error or a pause request.
IntEr	2	0x0	INT_DSI_ERR An interrupt was requested by a DSI_ERR register error.
IntRxEr	1	0x0	INT_DSI_RXERR An interrupt was requested by a DSI_RXERR register error.
IntAkEr	0	0x0	INT_DSI_ACKERR An interrupt was requested by a DSI_ACKERR register error.

Each bit can indirectly clear a register value either when “1” is written to the bit of each corresponding DSI_INT_CLR register.

6.2.43 DSI_INT_ENA Register (DSI_INT_ENA: 0x0418)

Bit	B31	B30	B29	B28	B27	B26	B25	B24
Name	Reserved							
Type	RO							
Default	0x00							
Bit	B23	B22	B21	B20	B19	B18	B17	B16
Name	Reserved					IEnAk	Reserved	
Type	RO					RO	RO	
Default	0x00					0	0x0	
Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved							
Type	RO							
Default	0x00							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	Reserved				IEnHlt	IEnEr	IEnRxEr	IEnAkEr

Type	RO	RO	RO	RO	RO
Default	0x0	0	0	0	0

Table 6-43 DSI_INT_ENA Register

Register Field	Bit	Default	Description				
Reserved	[31:19]	0x0					
IEnAk	18	0x0	INTENA_ACK This bit enables interrupt notification by INT_ACK sources.				
Reserved	[17:4]	0x0					
IEnHlt	3	0x0	INTENA_HALTED This bit enables interrupt notification by INT_HALTED sources.				
IEnEr	2	0x0	INTENA_DSI_ERR This bit enables interrupt notification by INT_DSI_ERR sources.				
IEnRxEr	1	0x0	INTENA_DSI_RXERR This bit enables interrupt notification by INT_DSI_RXERR sources.				
IEnAkEr	0	0x0	INTENA_DSI_ACKERR This bit enables interrupt notification by INT_DSI_ACKERR sources.				

Only indirect writing, i.e. write to DSI_CONFW with [Addr] = 0x06.

6.2.44 DSI Command Read Data FIFO Register (DSICMD_RXFIFO: 0x0430)

Bit	B31	B30	B29	B28	B27	B26	B25	B24
Name	RDDATA[31:24]							
Type	RO	RO	RO	RO	RO	RO	RO	RO
Default	0	0	0	0	0	0	0	0
Bit	B23	B22	B21	B20	B19	B18	B17	B16
Name	RDDATA[23:16]							
Type	RO	RO	RO	RO	RO	RO	RO	RO
Default	0	0	0	0	0	0	0	0
Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	RDDATA[15:8]							
Type	RO	RO	RO	RO	RO	RO	RO	RO
Default	0	0	0	0	0	0	0	0
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	RDDATA[7:0]							
Type	RO	RO	RO	RO	RO	RO	RO	RO
Default	0	0	0	0	0	0	0	0

Table 6-44 DSI Command Read Data FIFO Register

Register Field	Bit	Default	Description
----------------	-----	---------	-------------

RDDATA	[31:0]	0x0	RDDATA Data received from the peripheral interface via the DSI link is written to this register.					
--------	--------	-----	--	--	--	--	--	--

The data received via a DSI link was written to this register.

6.2.45 DSI_ACKERR Register (DSI_ACKERR: 0x0434)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	ACKERR_REPORT[15:8]							
Type	RO	RO	RO	RO	RO	RO	RO	RO
Default	0	0	0	0	0	0	0	0
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	ACKERR_REPORT[7:0]							
Type	RO	RO	RO	RO	RO	RO	RO	RO
Default	0	0	0	0	0	0	0	0

Table 6-29 ACKERR_REPORT Register

Register Field	Bit	Default	Description
Reserved	[31:16]	0x0	
ACKERR_REPORT	[15:0]	0x0	ACKERR_REPORT The content of the Acknowledge packet with report of the last error received is held.

The content of the DSI_ACKERR register is cleared when the register is read.

6.2.46 DSI_ACKERR_INTENA Register (DSI_ACKERR_INTENA: 0x0438)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	DSI_ACKERR_INTENA[15:8]							
Type	RO	RO	RO	RO	RO	RO	RO	RO
Default	0	0	0	0	0	0	0	0
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	DSI_ACKERR_INTENA[7:0]							
Type	RO	RO	RO	RO	RO	RO	RO	RO
Default	0	0	0	0	0	0	0	0

Table 6-45 DSI_ACKERR_INTENA Register

Register Field	Bit	Default	Description
Reserved	[31:16]	0x0	

DSI_ACKERR_INTENA	[15:0]	0x0	DSI_ACKERR_INTENA This field sets the generation of interrupts when an acknowledge packet with error report is received. Setting each bit in this field enables generation of the DSI_ACKERR_INT interrupt which corresponds to the DSI_ACKERR register error.
-------------------	--------	-----	--

Only indirect writing, i.e. write to DSI_CONFW with [Addr] = 0x0E.

6.2.47 DSI_ACKERR_HALT Register (DSI_ACKERR_HALT: 0x043C)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	DSI_ACKERR_HALT[15:8]							
Type	RO	RO	RO	RO	RO	RO	RO	RO
Default	0	0	0	0	0	0	0	0
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	DSI_ACKERR_HALT[7:0]							
Type	RO	RO	RO	RO	RO	RO	RO	RO
Default	0	0	0	0	0	0	0	0

Table 6-46 DSI_ACKERR_HALT Register

Register Field	Bit	Default	Description
Reserved	[31:16]	0x0	
DSI_ACKERR_HALT	[15:0]	0x0	DSI_ACKERR_HALT This field controls operation of the DSI-TX module when an acknowledge packet with error report is received. The DSI-TX module halts command processes when an error is received for which the corresponding bit in the DSI_ACKERR_INTENA and DSI_ACKERR_HALT registers is set.

Only indirect writing, i.e. write to DSI_CONFW with [Addr] = 0x0F.

6.2.48 DSI_RXERR Register (DSI_RXERR: 0x0440)

Bit	B23	B22	B21	B20	B19	B18	B17	B16
Name	Reserved			TATo	RxHTo	Reserved	FOverFlw	Reserved
Type	RO			RO	RO	RO	RO	RO
Default	0		0	0	0	0	0	0
Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved		InCmplTx	Reserved	DTErr	CRCErr	ECCSErr	ECCMErr
Type	RO		RO	RO	RO	RO	RO	RO
Default	0		0	0	0	0	0	0
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	Reserved	LPCtlErr	Reserved	LPSyncErr	EscErr	Reserved		
Type	RO	RO	RO	RO	RO	RO		

Default	0	0	0	0	0	0
---------	---	---	---	---	---	---

Table 6-29 DSI_RXERR Register

Register Field	Bit	Default	Description
Reserved	[31:21]	0x0	
TATo	20	0x0	TA_TO This bit indicates direction change acknowledgement timeouts.
RxHTo	19	0x0	LRX-H_TO This bit indicates LP-RX host processor timeouts.
Reserved	18	0x0	
FOvrFlw	17	0x0	FIFO_OVERFLOW This bit indicates Receive FIFO overflows.
Reserved	[16:14]	0x0	
InCmplTx	13		Incomplete Tx
Reserved	12	0x0	
DTErr	11		DSI packet Data Type is not reconized
CRCErr	10		CRC Error
ECCSErr	9		ECC Error, Single bit
ECCMErr	8		ECC Error, Multi- bits
Reserved	7	0x0	
CtlErr	6		False Control Error
Reserved	5		
LPSyncErr	4		LP Sync Error
EscErr	3		Escape Mode Entry Error
Reserved	[2:0]	0x0	

The content of the DSI_RXERR register is cleared when the register is read.

6.2.49 DSI_RXERR_INTENA Register (DSI_RXERR_INTENA: 0x0444)

Bit	B31	B30	B29	B28	B27	B26	B25	B24	
Name	Reserved								
Type	RO	RO	RO	RO	RO	RO	RO	RO	
Default	0	0	0	0	0	0	0	0	
Bit	B23	B22	B21	B20	B19	B18	B17	B16	
Name	Reserved			DSI_RXERR_INTENA[20:16]					
Type	RO	RO	RO	RO	RO	RO	RO	RO	
Default	0	0	0	0	0	0	0	0	
Bit	B15	B14	B13	B12	B11	B10	B9	B8	
Name	DSI_RXERR_INTENA[15:8]								
Type	RO	RO	RO	RO	RO	RO	RO	RO	
Default	0	0	0	0	0	0	0	0	

Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	DSI_RXERR_INTENA[7:0]							
Type	RO	RO	RO	RO	RO	RO	RO	RO
Default	0	0	0	0	0	0	0	0

Table 6-47 DSI_RXERR_INTENA Register

Register Field	Bit	Default	Description
Reserved	[31:21]	0x0	
DSI_RXERR_INTENA	[20:0]	0x0	DSI_RXERR_INTENA This field controls generation of interrupts when the DSI_RXERR register is notified of an error. Each bit in this field enables generation of the DSI_RXERR_INT interrupt which corresponds to the DSI_RXERR register error.

Only indirect writing, i.e. write to DSI_CONFW with [Addr] = 0x11.

6.2.50 DSI_RXERR_HALT Register (DSI_RXERR_HALT: 0x0448)

Bit	B31	B30	B29	B28	B27	B26	B25	B24	
Name	Reserved								
Type	RO	RO	RO	RO	RO	RO	RO	RO	
Default	0	0	0	0	0	0	0	0	
Bit	B23	B22	B21	B20	B19	B18	B17	B16	
Name	Reserved			DSI_RXERR_HALT[20:16]					
Type	RO	RO	RO	RO	RO	RO	RO	RO	
Default	0	0	0	0	0	0	0	0	
Bit	B15	B14	B13	B12	B11	B10	B9	B8	
Name	DSI_RXERR_HALT[15:8]								
Type	RO	RO	RO	RO	RO	RO	RO	RO	
Default	0	0	0	0	0	0	0	0	
Bit	B7	B6	B5	B4	B3	B2	B1	B0	
Name	DSI_RXERR_HALT[7:0]								
Type	RO	RO	RO	RO	RO	RO	RO	RO	
Default	0	0	0	0	0	0	0	0	

Table 6-48 DSI_RXERR_HALT Register

Register Field	Bit	Default	Description
Reserved	[31:21]	0x0	
DSI_RXERR_HALT	[20:0]	0x0	DSI_RXERR_HALT This field controls DSI-TX operation for when an error has been reported to the DSI_RXERR register. The DSI-TX module stops

			command processing when it receives an error corresponding to the set bits in the DSI_RXERR_INTENA and DSI_RXERR_HALT registers.
--	--	--	--

Only indirect writing, i.e. write to DSI_CONFW with [Addr] = 0x12.

6.2.51 DSI_ERR Register (DSI_ERR: 0x044C)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved						InEr	WCer
Type	RO						RO	RO
Default	0x00						0	0
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	SynTo	RxFRdEr	TeEr	QUnk	QWrEr	HTxTo	HTxBRK	Cntn
Type	RO	RO	RO	RO	RO	RO	RO	RO
Default	0	0	0	0	0	0	0	0

Table 6-29 DSI_ERR Register

Register Field	Bit	Default	Description
Reserved	[31:10]	0x0	
InEr	9	0x0	INTERNAL_ERROR This bit indicates that another internal error occurred.
WCer	8	0x0	WC_ERROR This bit indicates that more bytes than expected were received from the PDIF. Because distinguishing the current data from the next payload data of continuous transfers is difficult when the last payload data is 4-byte aligned, this error is not detected.
SynTo	7	0x0	SYNC_TO This bit indicates that a synchronous wait timeout occurred.
RxFRdEr	6	0x0	RXFIFO_RDERR This bit indicates that an empty Receive FIFO was read.
TeEr	5	0x0	TE_ERROR This bit indicates that the peripheral interface did not transmit the tearing trigger the DSI-TX module is expecting.
QUnk	4	0x0	CQ_UNKNOWN This bit indicates that an unknown command or incorrect parameter was detected by the command queue.
QWrEr	3	0x0	CQ_WRERR This bit indicates that Write access to a full command queue occurred.
HTxTo	2	0x0	HTX_TO This bit indicates that a High-Speed TX timeout occurred.
HTxBRK	1	0x0	HSTX_BROKEN This bit indicates that the byte stream was disrupted during High-Speed transfer.
Cntn	0	0x0	CONTENTION This bit indicates that a contention was detected during lower power transfer.

The content of the DSI_ERR register is cleared by reading it out.

6.2.52 DSI_ERR_INTENA (DSI_ERR_INTENA: 0x0450)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved							DSI_ERR_INTENA[9:8]
Type	RO							RO
Default	0x00							0
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	DSI_ERR_INTENA[7:0]							
Type	RO							
Default	0x00							

Table 6-49 DSI_ERR_INTENA Register

Register Field	Bit	Default	Description
Reserved	[31:10]	0x0	
DSI_ERR_INTENA	[9:0]	0x0 (??)	DSI_ERR_INTENA This field controls interrupt generation for when an error has been reported to the DSI_ERR register. Generation of the DSI_ERR_INT interrupt which corresponds to the DSI_ERR register error is enabled.

Only indirect writing, i.e. write to DSI_CONFW with [Addr] = 0x14.

6.2.53 DSI_ERR_HALT Register (DSI_ERR_HALT: 0x0454)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved							DSI_ERR_HALT[9:8]
Type	RO							RO
Default	0x00							0
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	DSI_ERR_HALT[7:0]							
Type	RO							
Default	0x00							

Table 6-50 DSI_ERR_HALT Register

Register Field	Bit	Default	Description
Reserved	[31:10]	0x0	
DSI_ERR_HALT	[9:0]	0x0 (??)	DSI_ERR_HALT This field controls DSI-TX operation for when an error is reported to the DSI_ERR register. The DSI-TX module stops command processing when it receives an error corresponding to the set bits in the DSI_ERR_INTENA and DSI_ERR_HALT registers. (??)

Only indirect writing, i.e. write to DSI_CONFW with [Addr] = 0x15.

6.2.54 DSI Configuration Register (DSI_CONFW: 0x0500)

Bit	B31	B30	B29	B28	B27	B26	B25	B24
Name	MODE			Address				
Type	WO	WO	WO	WO	WO	WO	WO	WO
Default	0	0	0	0	0	0	0	0
Bit	B23	B22	B21	B20	B19	B18	B17	B16
Name	Reserved[23:16]							
Type	WO	WO	WO	WO	WO	WO	WO	WO
Default	0	0	0	0	0	0	0	0
Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	DATA[15:8]							
Type	WO	WO	WO	WO	WO	WO	WO	WO
Default	0	0	0	0	0	0	0	0
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	DATA[7:0]							
Type	WO	WO	WO	WO	WO	WO	WO	WO
Default	0	0	0	0	0	0	0	0

Table 6-51 DSI Configuration Write Register

Register Field	Bit	Default	Description
MODE	[31:29]	0x0	Set or Clear AddrReg (register specified in Address field) Bits 3'b101: Set Register Bits in AddReg as indicated in DATA field 3'b110: Clear Register Bits in AddReg as indicated in DATA field Others: Reserved
Address	[28:24]	0x0	Address Field 0x03: DSI_Control, 0x040C, Register 0x06: DSI_INT_ENA, 0x418, Register 0x0E: DSI_ACKERR_INTENA, 0x0438, Register 0x0F: DSI_ACKERR_HALT, 0x043C, Register 0x11: DSI_RXERR_INTENA, 0x0444 Register 0x12: DSI_RXERR_HALT, 0x0448, Register 0x14: DSI_ERR_INTENA, 0x0450, Register 0x15: DSI_ERR_HALT, 0x0454, Register Others: Reserved
Reserved	[23:16]	0x0	
DATA	[15:0]	0x0	DATA Field When location DATA[n] is set to '1', the corresponding bit at AddrReg[n] will be cleared or set depending on MODE bits described above. Multiples bits can be set simultaneously

Note: Write to DSI_CONFW Register results to changes in corresponding bit changed in Addressed Register.

6.2.55 DSI LP Command (DSI_LPCMD: 0x0500)

Bit	B31	B30	B29	B28	B27	B26	B25	B24
Name	LP Command							
Type	WO	WO	WO	WO	WO	WO	WO	WO
Default	0	0	1	1	0	0	0	0
Bit	B23	B22	B21	B20	B19	B18	B17	B16
Name	Reserved[23:16]							
Type	WO							
Default	0xXX							
Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved[15:8]							
Type	WO							
Default	0xXX							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	LANE_ENA					LP_Code		
Type	WO	WO	WO	WO	WO	WO		
Default	0	0	0	0	0	0		

Note: This command share the same register as DSI_CONFW. It is in LP command mode when [31:24] = 0x30

Table 6-52 DSI Configuration Write Register

Register Field	Bit	Default	Description
LPCommand	[31:24]	0x0	LP Command Mode Selection 8'h30: Set Register Bits to this value to enable LP Command mode Others: Reserved
Reserved	[23:8]	0x0	Reserved
LANE_ENA	[7:3]	0x0	LANE Enable Field This Lane Enable is only used by LPC_CODE 000 (ULPS transition) and 001 (LP Stop transition). Select the following Lanes within the range of Lanes set to "Enable" by DSI_CONTROL[NOL]. Do not set ULPS transition and LP Stop transition for Lanes that have not been set to "Enable" by the NOL bit. LANE_ENA[3]: Select Clock Lanes LANE_ENA[4]: Select Lane 0 LANE_ENA[5]: Select Lane 1 LANE_ENA[6]: Select Lane 2 LANE_ENA[7]: Select Lane 3
LP_CODE	[2:0]	0x0	000: The Lane indicated by LANE_ENA transitions to ULPS (the ultra low power state). 001: The Lane indicated by LANE_ENA transitions to the LP stop state. 010: A remote application reset trigger is transmitted to Lane 0. Then, Lane 0 returns to the LP stop state. The state of other Lanes is not affected. 011: Bus direction change (BTA) is executed on Lane 0. After BTA, Lane 0 returns to the LP Stop state. Other Lanes are not affected. Others: Reserved

Note: Setting 0x0500 = 0x300000F8 will put the clock lane and all the data lanes into ULPS mode. While sending any packet during ULPS mode will cause DSI link to exit ULPS mode.

6.2.56 DSI RESET Register (DSI_RESET: 0x0504)

Bit	B7	B6	B5	B4	B3	B2	B1	B0	
Name	Reserved			RstRxF	Reserved			RstCnf	RstMdl
Type	RO			R/W	RO			R/W	R/W
Default	0			0	0			0	0

Table 6-53 DSI_RESET Register

Register Field	Bit	Default	Description
Reserved	[31:5]	0x0	
RstRxF	4	0x0	RST_RXFIFO 0: Operation is not affected. 1: The Receive FIFO is reset.
Reserved	[3:2]	0x0	Reserved
RstCnf	1	0x0	RST_CONF 0: Operation is not affected. 1: The setting register is reset.
RstMdl	0	0x0	RST_MODULE Do not set this bit to "1". Perform a hardware reset when a DSITX block reset is necessary. Use this bit when resetting the sub modules inside this block (DSI layer). The PHY layer or the application layer blocks are not reset. 0: Operation is not affected. 1: Modules inside the DSI layer are reset.

6.2.57 DSI_INT_CLR Register (DSI_INT_CLR: 0x050C)

Bit	B31	B30	B29	B28	B27	B26	B25	B24
Name	Reserved							
Type	RO							
Default	0x00

Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	Reserved[7:1]							
Type	RO	RO	RO	RO	RO	RO	RO	WO
Default	0	0	0	0	0	0	0	0

Table 6-55 DSI_START

Register Field	Bit	Default	Description
Reserved	[15:1]	0x0	
Strt	0	0x0	DSI_START 0: The clock is not supplied to modules other than CONIF. 1: The clock is supplied to all modules. When “1” is written to this bit, the clock is supplied to modules other than the DSI-TX CONIF. To start DSI-TX operation, set this bit to “1” after a reset is performed. This bit must be set to “1” even when accessing registers other than DSI_START. Once this bit is set to “1”, writing of “0” is not allowed. Perform a reset to change this bit from “1” to “0”.

6.2.59 DSI Command Packet Start Transmit Register (DSICMD_TX: 0x0600)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Reserved							
type	RO							
Default	0x0							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	Reserved							
type	RO							
Default	0x0

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name								tx_hsw
Type								R/W
Default								0x01
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name								tx_hsw
Type								R/W
Default								0x00

Table 6-67 DSI Hsync Width Register

Register Field	Bit	Default	Description
tx_hsw	[15:0]	0x0	Horizontal Blank Width Count $tx_hsw = \text{INT}\{ ((hsw \text{ in pixel} * \text{ByteClk_freq}) / \text{PCLK_freq}) * \text{DSI \#Data lane} \}$ Note: In Event mode, this count includes Horizontal Back porch

6.2.71 DSI HBPR Register (DSI_HBPR: 0x062A)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name								tx_hbp
Type								R/W
Default								0x01
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name								tx_hbp
Type								R/W
Default								0x0

Table 6-68 DSI HBPR Register

Register Field	Bit	Default	Description
tx_hbp	[15:0]	0x0	Horizontal Back Porch Count in Pulse Mode $tx_hbp = \text{INT}\{ ((hbp \text{ in pixel} * \text{HSByteCLK_freq}) / \text{PClk_freq}) * \text{DSI \#Data lane} \}$ Note: In Event mode, HBPR is included DSI_HSW register, this register is not used

6.2.72 DSI Horizontal Active Register (DSI_HACT: 0x062C)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name								tx_hal

type	R/W							
Default	0x0							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	tx_hal							
type	R/W							
Default	0x0							

Table 6-69 DSI Horizontal Active Register

Register Field	Bit	Default	Description
tx_hal	[15:0]	0x0	Horizontal Active Line Word Count tx_hal = (hal in pixel * #byte per pixel) Note: tx_hal indicates byte count (count by HS Byte clock)

Note: 768 output number of bytes depending on values programmed in this register.

*e.g. To transfer 1366-pixel RGB666 input with “packed” RGB666 video packets, please program 1368*18/8 = 3078 = 0xC06 for 768 to send out 1368 pixels/line with the last two dummy pixels*

6.2.73 VBuffer Control Register (VBufCtl: 0x00E0)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	VBuf_en	Tx_en	mask		Reserved		alcnt[9:8]	
Type	R/W	R/W	R/W		RO		R/W	
Default	0x0	0x0	0x0		0x0		0x1	
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	alcnt[7:0]							
Type	R/W							
Default	0x0							

Debug Active Video Line Count Register

Register Field	Bit	Description
VBuf_en	[15]	Enable Video Buffer for I2C/SPI Write 0: normal 1: enable I2C/SPI write to VB sram
Tx_en	[14]	Transmit Enable 0: Normal mode 1: Enable Tx logic
mask	[13]	Short Packets Mask Bit 0: Normal mode 1: Mask Out Short Pkt, such FS, FE generation for Command Mode Operation
Reserved	[12:10]	
alcnt	[9:0]	Active Line Count 10'h0: 1 line 10'h1: 2 line .. 10'h3FF: 1024 line

6.2.74 Debug Line Width Register (DBG_Width: 0x00E2)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
------------	-----	-----	-----	-----	-----	-----	----	----

Name	Reserved								Db_width[11:8]

Bit	B7	B6	B5	B4	B3	B2	B1	B0	
Name	Db_awcnt[7:0]								
Type	R/W								
Default	0x0								

Debug Video Line Word Count Register

Register Field	Bit	Description
Reserved	[15:12]	
Db_width	[11:0]	Debug Total byte count in a line (include blank period) 12'h0: 1 byte 12'h1: 2 bytes .. 12'hFFE: 4095 bytes 12'hFFF: Reserved, Do not use

6.2.75 DebugVertical Blank Line Count Register (DBG_VBlank: 0x00E4)

Bit	B15	B14	B13	B12	B11	B10	B9	B8	
Name	Reserved								
Type	RO								
Default	0x0								
Bit	B7	B6	B5	B4	B3	B2	B1	B0	
Name	Reserved	Db_vb[6:0]							
Type	RO	R/W							
Default	0x0	0x10							

Debug Vertical Blank Register

Register Field	Bit	Description
Reserved	[15:7]	
Db_vb	[6:0]	Debug Vertical Blank line 7'h0: 1 line 7'h1: 2 line .. 7'7F:128 line

6.2.76 DebugVideo Data Register (DBG_Data: 0x00E8)

Bit	B15	B14	B13	B12	B11	B10	B9	B8
Name	Db_data[15:8]							
Type	WO							
Default	0xX							
Bit	B7	B6	B5	B4	B3	B2	B1	B0
Name	Db_data[7:0]							
Type	WO							
Default	0xX							

Debug Video DataRegister

Register Field	Bit	Description
Db_data	[15:0]	Data will be written into Video FIFO in continuous. Note: must be in multiple of 4 bytes

7 Package

7.1 TC358768A Package

The packages for TC358768AXBG are described in the figures below.

Figure 7-1P-VFBGA72-0404-0.40A3 package

Table 7-1P-VFBGA72-0404-0.40A3Mechanical Dimension

Dimension	Min.	Typ.	Max.
Solder ball pitch	---	0.4 mm	---
Solder ball height	0.15 mm	0.2 mm	0.205 mm
Package dimension	---	4.5 x 4.5 mm ²	---
Package height	---	---	1.0 mm

7.2 TC358778 Package

The packages for TC358778XBGA are described in the figures below.

Figure 7-2 P-VFBGA80-0707-0.65 package

Table 7-2 P-VFBGA80-0707-0.65 Mechanical Dimension

Dimension	Min.	Typ.	Max.
Solder ball pitch	---	0.65 mm	---
Solder ball height	0.20 mm	0.25 mm	0.30 mm
Package dimension	---	7.0 x 7.0 mm ²	---
Package height	---	---	1.0 mm

8 Electrical Characteristics

8.1 Absolute Maximum Ratings

VSS= 0V reference

Parameter	Symbol	Rating	Unit
Supply voltage (1.8V - Digital IO)	VDDIO	-0.3 ~ +3.9	V
Supply voltage (1.2V – Digital Core)	VDDC	-0.3 ~ +1.8	V
Supply voltage (1.2V – MIPI PHY)	VDD_MIPI	-0.3 ~ +1.8	V
Input voltage (DSI IO)	V _{IN_DSI}	-0.3 ~ VDD_MIPI+0.3	V
Output voltage (DSI IO)	V _{OUT_DSI}	-0.3 ~ VDD_MIPI+0.3	V
Input voltage (Digital IO)	V _{IN_IO}	-0.3 ~ VDDIO+0.3	V
Output voltage (Digital IO)	V _{OUT_IO}	-0.3 ~ VDDIO+0.3	V
Junction temperature	T _j	125	°C
Storage temperature	T _{stg}	-40 ~ +125	°C

8.2 Recommended Operating Condition

VSS= 0V reference

Parameter	Symbol	Min.	Typ.	Max.	Unit
Supply voltage (1.8V – Digital IO)	VDDIO	1.65	1.8	1.95	V
Supply voltage (3.3V – Digital IO)	VDDIO	3.0	3.3	3.6	V
Supply voltage (1.2V – Digital Core)	VDDC	1.1	1.2	1.3	V
Supply voltage (1.2V – MIPI PHY)	VDD_MIPI	1.1	1.2	1.3	V
Operating temperature (ambient temperature with voltage applied)	T _a	-30	+25	+85	°C
Supply Noise Voltage	V _{SN}			100	mV _{pp}

8.3 DC Electrical Specification

Parameter	Symbol	Min.	Typ.	Max.	Unit
Input voltage, High level input Note1	V _{IH}	0.7 VDDIO		VDDIO	V
Input voltage, Low level input Note1	V _{IL}	0		0.3 VDDIO	V
Input voltage High level CMOS Schmitt Trigger Note1,2	V _{IHS}	0.7 VDDIO		VDDIO	V
Input voltage Low level CMOS Schmitt Trigger Note1,2	V _{ILS}	0		0.3 VDDIO	V

Output voltage High level^{Note1, Note2} (Condition: $I_{OH} = -0.4\text{mA}$)	V_{OH}	0.8 VDDIO		VDDIO	V
Output voltage Low level^{Note1, Note2} (Condition: $I_{OL} = 2\text{mA}$)	V_{OL}	0		0.2 VDDIO	V
Input leak current, High level (Normal IO or Pull-up IO) (Condition: $V_{IN} = +VDDIO$, $VDDIO = 3.6\text{V}$)	I_{ILH1} ^{Note3}	-10	-	10	uA
Input leak current,High level (Pull-down IO) (Condition: $V_{IN} = +VDDIO$, $VDDIO = 3.6\text{V}$)	I_{ILH2} ^{Note3}	-	-	100	uA
Input leak current,Low level (Normal IO or Pull-down IO) (Condition: $V_{IN} = 0\text{V}$, $VDDIO = 3.6\text{V}$)	I_{ILL1} ^{Note4}	-10	-	10	uA
Input leak current,Low level (Pull-up IO) (Condition: $V_{IN} = 0\text{V}$, $VDDIO = 3.6\text{V}$)	I_{ILL2} ^{Note4}	-	-	200	uA

Note1 : Each power source is operating within recommended operation condition.

Note2 : Current output value is specified to each IO buffer individually. Output voltage changes with output current value.

Note3 : Normal pin or Pull-up IO pin applied VDDIO supply voltage to Vin (input voltage)

Note4 : Normal pin or Pull-down IO pin applied VSSIO (0V) to Vin (input voltage)

9 Timing Definitions

9.1 MIPI Timings

Timing specification below has been ported from MIPI Alliance specification for D-PHY version 01-00-00. Timing defined in MIPI Alliance specification for D-PHY version 01-00-00 has precedence over timing described in the sections below.

Figure 9-1 Signaling and voltage levels

Table 9-1 MIPI Tx DC specifications

Parameter	Description	Min	Nom	Max	Units	Notes
HS mode						
VCMTX	HS transmit static common mode voltage	150	200	250	mV	1
ΔVCMTX(1,0)	VCMTX mismatch when output is Differential-1 or Differential-0			5	mV	2
VOD	HS transmit differential voltage	140	200	270	mV	1
ΔVOD	VOD mismatch when output is Differential-1 or Differential-0			10	mV	2
VOHHS	HS output high voltage			360	mV	
ZOS	Single ended output impedance	40	50	62.5	Ω	
ΔZOS	Single ended output impedance mismatch			10	%	
LP Mode						
VOH	Thevenin output high level	1.1	1.2	1.3	V	
VOL	Thevenin output low level	-50		50	mV	
ZOLP	Output impedance of LP transmitter	110			Ω	3

Notes:

- Value when driving into load impedance anywhere in the ZID range.

2. It is recommended the implementer minimize ΔVOD and $\Delta VCMTX(1,0)$ in order to minimize radiation and optimize signal integrity.
3. Though no maximum value for ZOLP is specified, the LP transmitter output impedance shall ensure the TRLP/TFLP specification is met.

Table 9-2 MIPI High Speed Tx AC specifications

Parameter	Description	Min	Nom	Max	Units	Notes
$\Delta VCMTX(HF)$	Common-level variations above 450MHz			15	mVRMS	
$\Delta VCMTX(LF)$	Common-level variation between 50-450MHz			25	mVPEAK	
tR and tF	20%-80% rise time and fall time			0.3	UI	1
		150			ps	

Notes:

1. UI is equal to $1/(2*fh)$. See section 7.3 for the definition of fh.

Table 9-3 MIPI Low Power Tx AC characteristics

Parameter	Description		Min	Nom	Max	Units	Notes
TRLP/TFLP	15%-85% rise time and fall time				25	ns	1
TREOT	30%-85% rise time and fall time				35	ns	1, 5, 6
	Pulse width of the LP exclusive-OR clock	First LP exclusive-OR clock pulse after Stop state or last pulse before Stop state	40			ns	4
		All other pulses	20			ns	4
TLP-PER-TX	Period of the LP exclusive-OR clock		90			ns	
$\delta V/\delta t_{SR}$	Slew rate @ CLOAD = 0pF	30		500	mV/ns	1,2,3,7	
	Slew rate @ CLOAD = 5pF	30		200	mV/ns	1,2,3,7	
	Slew rate @ CLOAD = 20pF	30		150	mV/ns	1,2,3,7	
	Slew rate @ CLOAD = 70pF	30		100	mV/ns	1,2,3,7	
CLOAD	Load capacitance	0		70	pF	1	

Notes:

1. CLOAD includes the low-frequency equivalent transmission line capacitance. The capacitance of TX and RX are assumed to always be <10pF. The distributed line capacitance can be up to 50pF for a transmission line with 2ns delay.
2. When the output voltage is between 15% and below 85% of the fully settled LP signal levels.
3. Measured as average across any 50 mV segment of the output signal transition.
4. This parameter value can be lower than TLPX due to differences in rise vs. fall signal slopes and trip levels and mismatches between Dp and Dn LP transmitters. Any LP exclusive-OR pulse observed during HS EoT (transition from HS level to LP-11) is glitch behavior.
5. The rise-time of TREOT starts from the HS common-level at the moment the differential amplitude drops below 70mV, due to stopping the differential drive.
6. With an additional load capacitance CCM between 0-60pF on the termination center tap at RX side of the Lane.

7. This value represents a corner point in a piecewise linear curve.

Figure 9-2 Data to clock timing reference

Table 9-4 Data-Clock timing specification

Parameter	Description	Min	Nom	Max	Units	Notes
T_{SKEW}	Data to clock skew measured at the transmitter	-0.15		0.15	UI_{INST}	
T_{SETUP}	Data to clock setup time at receiver	0.15			UI_{INST}	
T_{HOLD}	clock to data hold time at receiver	0.15			UI_{INST}	
UI_{INST}	1 Data bit time (instantaneous)			12.5	ns	
T_{CLKp}	Period of dual data rate clock	2	2	2	UI_{INST}	

9.2 I2C Timings

Item	Symbol	Min	Max	Unit
SCL clock frequency	f_{SCL}	0	400	kHz
Hold time (repeated) START condition. After this period, the first clock pulse is generated	$t_{HOLD;STA}$	0.6	-	μs
LOW period of the SCL clock	t_{LOW}	1.3	-	μs
HIGH period of the SCL clock	t_{HIGH}	0.6	-	μs
Set-up time for a repeated START condition	$t_{SETUP;STA}$	0.6	-	μs
Data hold time: for I2C-bus devices	$t_{HOLD;DAT}$	0	0.9	μs
Data set-up time	$t_{SETUP;DAT}$	100	-	ns
Rise time of both SDA and SCL signals	t_r	$20+0.1Cb$	300	ns
Fall time of both SDA and SCL signals	t_f	$20+0.1Cb$	300	ns
Set-up time for STOP condition	$t_{SETUP;STOP}$	0.6	-	μs
Bus free time between a STOP and START condition	t_{BUF}	1.3	-	μs

Note: C_b = Capacitive load for each bus line (400pF max.)

9.3 Parallel Port Input Timings

Table 9-5 Parallel Input timing

Parameter	Description	Min.	Typ.	Max.	Units
$T_{pd:SU}$	Setup time of data	2	-	-	ns
$T_{pd:HD}$	Hold time of data	1	-	-	ns
$T_{pd:CLK}$	Clock period	6	-	-	ns

Figure 9-3 Parallel Input timing

Table 9-6 Parallel Vertical timing

Parameter	Description	Min.	Typ.	Max.	Units
T_{VP}	Vertical Sync Period	2	-	-	Lines
T_{VBP}	Vertical Back Porch	2	-	-	Lines
T_{VAFP}	Vertical Active Frame Period	16	-	4096	Lines
T_{VFP}	Vertical Front Porch	2	-	-	Lines

Figure 9-4 Parallel Vertical timing

Table 9-7 Parallel Horizontal timing

Parameter	Description	Min.	Typ.	Max.	Units
T_{HP}	Horizontal Sync Period	8	-	-	PCLK
T_{HBP}	Horizontal Back Porch	2	-	-	PCLK
T_{HAFP}	Horizontal Active Line Period	16	-	1920	PCLK
T_{HFP}	Horizontal Front Porch	2	-	-	PCLK

**Figure 9-5 Parallel Horinzontal timing**

9.4 SPI Input/Output Timings

Table 9-8 SPI timing

Parameter	Symbol	Min	Typ	Max	Unit
SPI Clock Frequency	f_{SEIS}	—	—	25	MHz
Clock to Data (MISO) Valid Time	t_{SOD}	—	—	15	ns
Clock to Data (MISO) Invalid Time	t_{SOH}	0	—	—	ns
Data in (MOSI) Setup Time	t_{SIS}	5	—	—	ns
Data in (MOSI) Hold Time	t_{SIH}	5	—	—	ns
Slave Select to Data (MISO) Valid Time	t_{SSDV}	—	—	25 ¹	ns
Slave Select to Clock	t_{SSTC}	$3/f_{SYS}$	—	—	ns
Consecutive Transfer Delay Time	t_{CTDT}	$1/f_{SEIS}$	—	—	ns
Load on SEI Interface Signals	C_{IF}	—	—	10	pF

Notes: Maximum loading of MISO is 10pF

Figure 9-6SPI timing (data valid on second active clock edge)

RESTRICTIONS ON PRODUCT USE

- This document and any information herein may not be reproduced without prior written permission from TOSHIBA. Even with TOSHIBA's written permission, reproduction is permissible only if reproduction is without alteration/omission.
- Though TOSHIBA works continually to improve Product's quality and reliability, Product can malfunction or fail. Customers are responsible for complying with safety standards and for providing adequate designs and safeguards for their hardware, software and systems which minimize risk and avoid situations in which a malfunction or failure of Product could cause loss of human life, bodily injury or damage to property, including data loss or corruption. Before customers use the Product, create designs including the Product, or incorporate the Product into their own applications, customers must also refer to and comply with (a) the latest versions of all relevant TOSHIBA information, including without limitation, this document, the specifications, the data sheets and application notes for Product and the precautions and conditions set forth in the "TOSHIBA Semiconductor Reliability Handbook" and (b) the instructions for the application with which the Product will be used with or for. Customers are solely responsible for all aspects of their own product design or applications, including but not limited to (a) determining the appropriateness of the use of this Product in such design or applications; (b) evaluating and determining the applicability of any information contained in this document, or in charts, diagrams, programs, algorithms, sample application circuits, or any other referenced documents; and (c) validating all operating parameters for such designs and applications. **TOSHIBA ASSUMES NO LIABILITY FOR CUSTOMERS' PRODUCT DESIGN OR APPLICATIONS.**
- **PRODUCT IS NEITHER INTENDED NOR WARRANTED FOR USE IN EQUIPMENTS OR SYSTEMS THAT REQUIRE EXTRAORDINARILY HIGH LEVELS OF QUALITY AND/OR RELIABILITY, AND/OR A MALFUNCTION OR FAILURE OF WHICH MAY CAUSE LOSS OF HUMAN LIFE, BODILY INJURY, SERIOUS PROPERTY DAMAGE AND/OR SERIOUS PUBLIC IMPACT ("UNINTENDED USE").** Except for specific applications as expressly stated in this document, Unintended Use includes, without limitation, equipment used in nuclear facilities, equipment used in the aerospace industry, medical equipment, equipment used for automobiles, trains, ships and other transportation, traffic signaling equipment, equipment used to control combustions or explosions, safety devices, elevators and escalators, devices related to electric power, and equipment used in finance-related fields. **IF YOU USE PRODUCT FOR UNINTENDED USE, TOSHIBA ASSUMES NO LIABILITY FOR PRODUCT.** For details, please contact your TOSHIBA sales representative.
- Do not disassemble, analyze, reverse-engineer, alter, modify, translate or copy Product, whether in whole or in part.
- Product shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable laws or regulations.
- The information contained herein is presented only as guidance for Product use. No responsibility is assumed by TOSHIBA for any infringement of patents or any other intellectual property rights of third parties that may result from the use of Product. No license to any intellectual property right is granted by this document, whether express or implied, by estoppel or otherwise.
- **ABSENT A WRITTEN SIGNED AGREEMENT, EXCEPT AS PROVIDED IN THE RELEVANT TERMS AND CONDITIONS OF SALE FOR PRODUCT, AND TO THE MAXIMUM EXTENT ALLOWABLE BY LAW, TOSHIBA (1) ASSUMES NO LIABILITY WHATSOEVER, INCLUDING WITHOUT LIMITATION, INDIRECT, CONSEQUENTIAL, SPECIAL, OR INCIDENTAL DAMAGES OR LOSS, INCLUDING WITHOUT LIMITATION, LOSS OF PROFITS, LOSS OF OPPORTUNITIES, BUSINESS INTERRUPTION AND LOSS OF DATA, AND (2) DISCLAIMS ANY AND ALL EXPRESS OR IMPLIED WARRANTIES AND CONDITIONS RELATED TO SALE, USE OF PRODUCT, OR INFORMATION, INCLUDING WARRANTIES OR CONDITIONS OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, ACCURACY OF INFORMATION, OR NONINFRINGEMENT.**
- Do not use or otherwise make available Product or related software or technology for any military purposes, including without limitation, for the design, development, use, stockpiling or manufacturing of nuclear, chemical, or biological weapons or missile technology products (mass destruction weapons). Product and related software and technology may be controlled under the applicable export laws and regulations including, without limitation, the Japanese Foreign Exchange and Foreign Trade Law and the U.S. Export Administration Regulations. Export and re-export of Product or related software or technology are strictly prohibited except in compliance with all applicable export laws and regulations.
- Please contact your TOSHIBA sales representative for details as to environmental matters such as the RoHS compatibility of Product. Please use Product in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. **TOSHIBA ASSUMES NO LIABILITY FOR DAMAGES OR LOSSES OCCURRING AS A RESULT OF NONCOMPLIANCE WITH APPLICABLE LAWS AND REGULATIONS.**
